01 About IKAF* Studio

About IKAF* Studio

01

1.1 Why IKAF*studio?

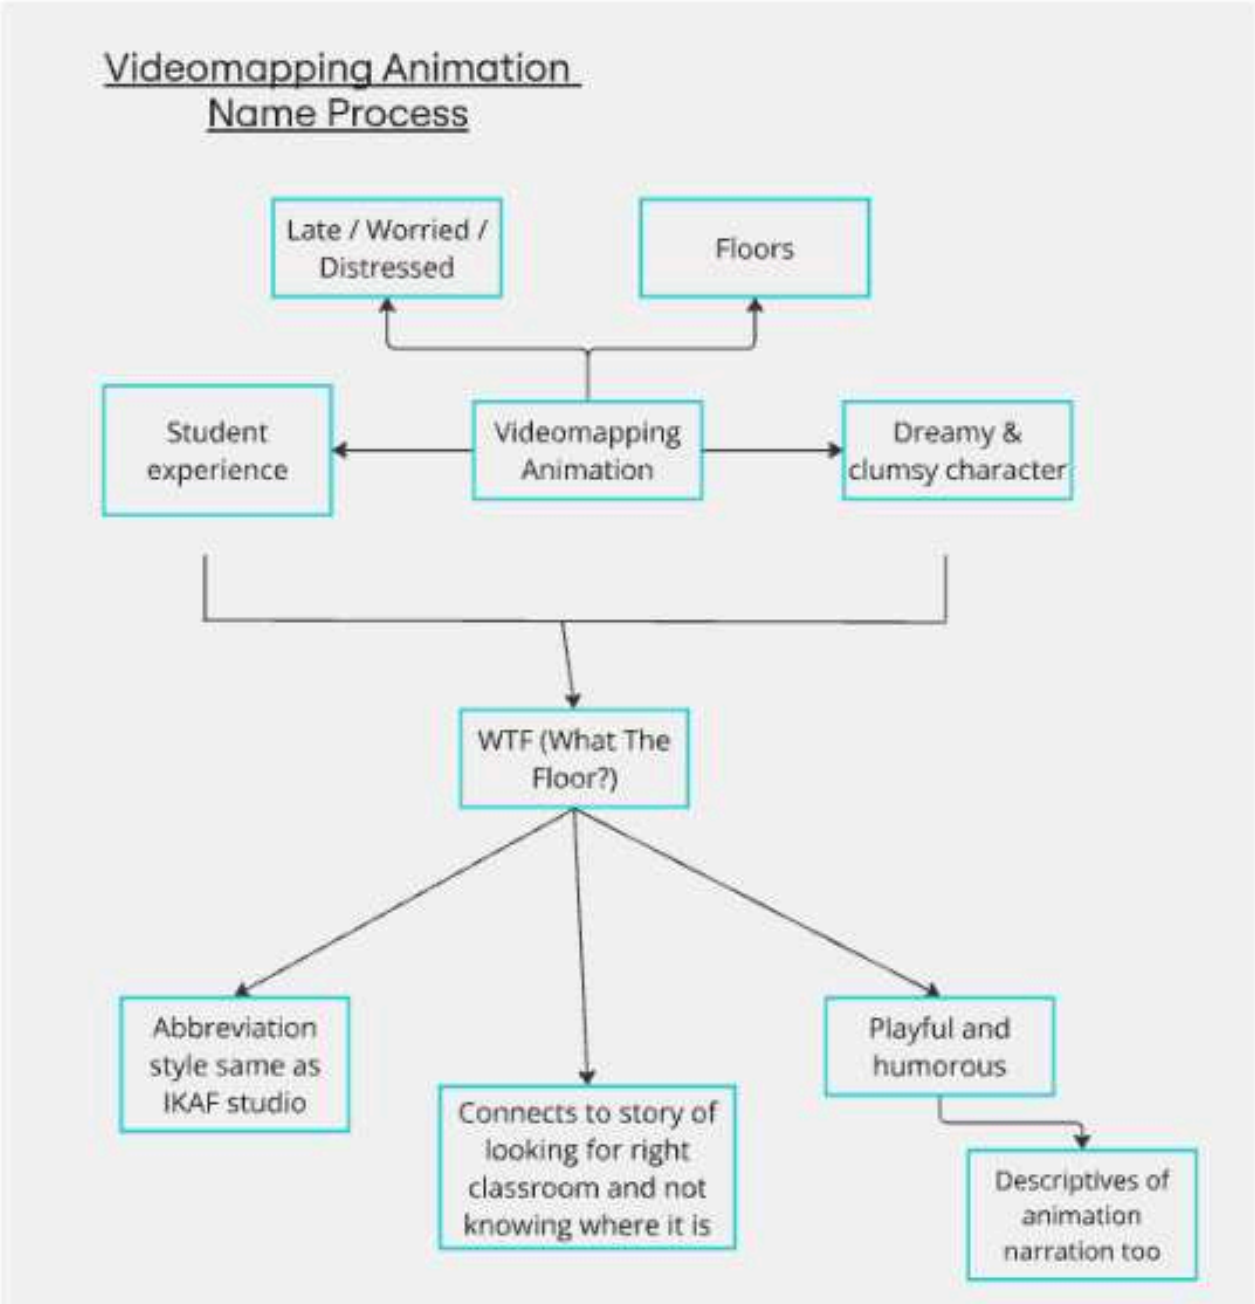

Naming workshop - brand

The name IKAF* stands for "I Know A Friend," reflecting our studio's core of collaboration, creativity, and a network-driven approach. The addition of the asterisk serves as a playful and intentional design choice, symbolizing an open-ended connection to explore why, which would take them to the meaning of it as an acronym. It reinforces the idea that IKAF* is more than just a studio; it's a dynamic collective where designers, technologists, and artists join skills to creat amazing projects. Our name illustrates the studio's friendly nature while maintaining a sense of professionalism. Below is our Miro board with the process for coming up with our name.

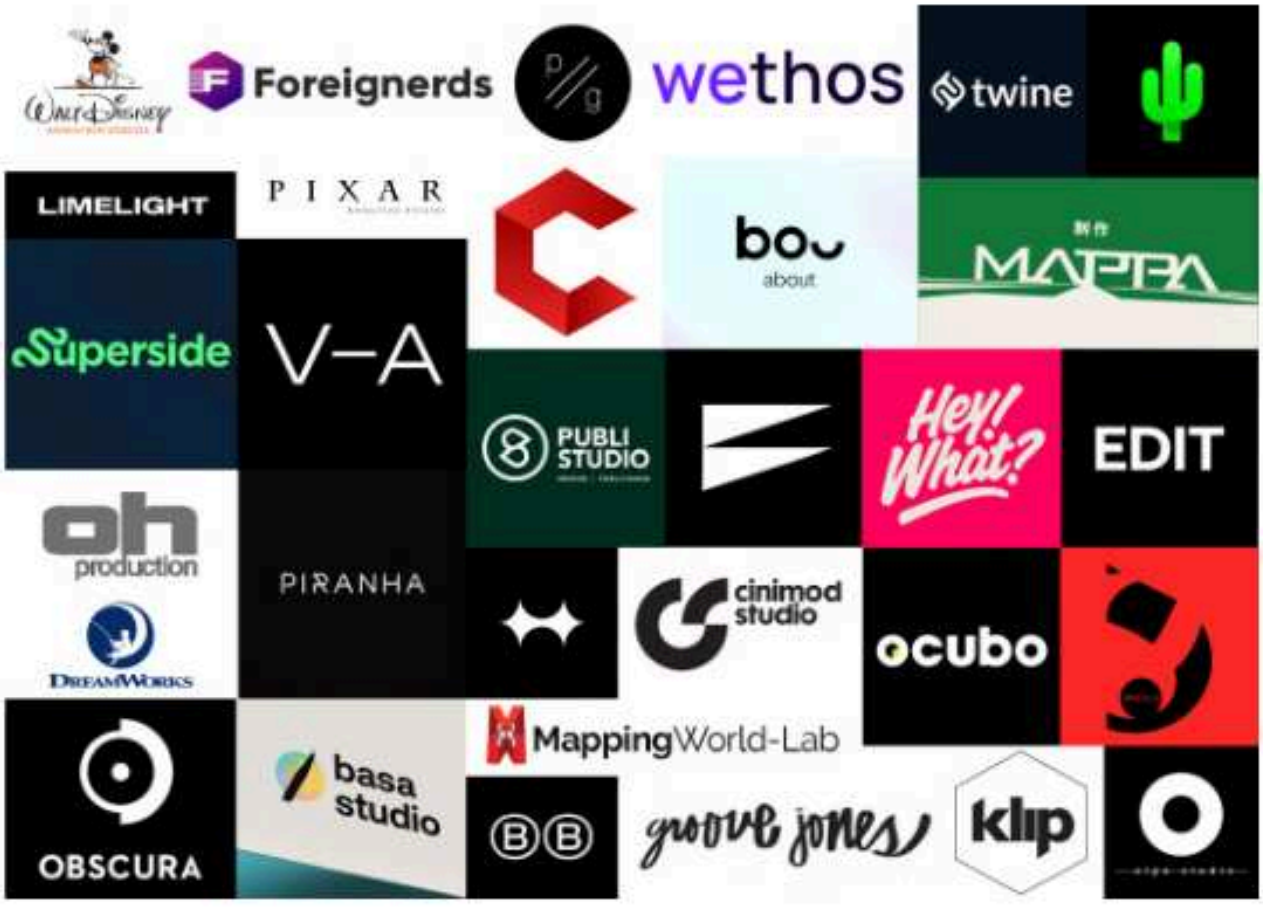

Naming workshop - videomapping

The name "What the Floor?" for our short film was the ideal combination of humor, chaos, and weirdness that our protagonist goes through in their journey through IADE's seven-story building. Playing on the phrase "What the...?" it sets a playful tone, immediately hinting at the fast-paced energy of the story. Each floor presents a new challenge, surreal twist, or nostalgic reference, creating a dynamic narrative, which the name expresses. Below is a simple mindmap that helps illustrate our thought process when developing the name.

1.2 Brand concepts

Competitors moodboard

This moodboard contains the logos of a variety of competitors studios and brand which we deemed are competitors with ikaf* studio.

These include animation studios, company that specializes in videomapping, as well as design and advertising studios.

Inspiration moodboard

The moodboard is meant to express the guiding spirit for the brand's style. Therefore, we thought of including images and visual identities similar to those we wanted to convey with our studio, with sinuous and friendly shapes.

The sans serif typo conveys a sense of simplicity and elegance, yet without being too refined. The asterisk symbol is also frequently taken up in various styles, symbolizing that behind a hypothetical graphic, there is also another meaning.

What is “ikaf* studio”?

Our team is composed by:

Main team

A group of designers and "creative technologists" who handle all projects, ensuring quality and proper execution.

Creative Network Platform

A curated talent pool of freelancers (artists, illustrators, sound designers, engineers, etc.) available for projects that require specialized skills outside the team's expertise.

Our services

We are a publicity and design studio that specializes in graphic design, advertising, animation, and immersive experiences with ample focus on interactive brand activations in festivals.

Through our extensive network of contacts of various freelancer artists, we are able to cover any assignment we are given, collaborating and making the best of all creative requests that are assigned to us. We believe that collaboration is essential in order to deliver a complete, high-quality product, and we stand as a guarantor between the buyer and a hypothetical freelancer.

Our "Hybrid" approach allows clients to get a dedicated creative team while also tapping into a broader creative network when needed, making the studio flexible, scalable and highly adaptable.

We want to be the buyer's first friend, someone you can trust and who can implement any idea that crosses your mind.

Our mission:

We bring together artists and freelancers to create immersive installations designed for festivals and fairs, blending storytelling, design, and technology to transform spaces into unique, immersive experiences. With innovation and meticulous care, we craft each project to push creative boundaries, ensuring every challenge is met with a distinct and thoughtful approach.

Brand objectives

Create immersive visual experiences that seamlessly integrate brand storytelling, design, and technology.

Connect clients with talented and specialized teams to effectively meet any unique project demands.

Enhancing public and temporary spaces through site-specific interventions that transform ordinary environments into extraordinary visual experiences, increasing brand visibility and impact.

Create **customized** visual experiences that reflect the vision and identity of each client or event, ensuring unique and memorable solutions.

Brand values

Flexibility

At IKAF* Studio, each project is unique. We adapt with ease to the demands of festivals, fairs and brands, offering tailored solutions through a fluid network of talent.

User-focused

We guarantee that our experiences are always designed with the users in mind, ensuring engagement and meaningful connections.

Transparency

We strongly advocate for an open communication and honesty with everything we do, granting our client's with a trustworthy team and a clear work progress.

Approachability

We believe in the importance of a direct and authentic relationship. We are always available, friendly and ready to support customers and artists at every stage of the collaboration, creating a welcoming and trusting environment.

1.3 Color palette

Palette

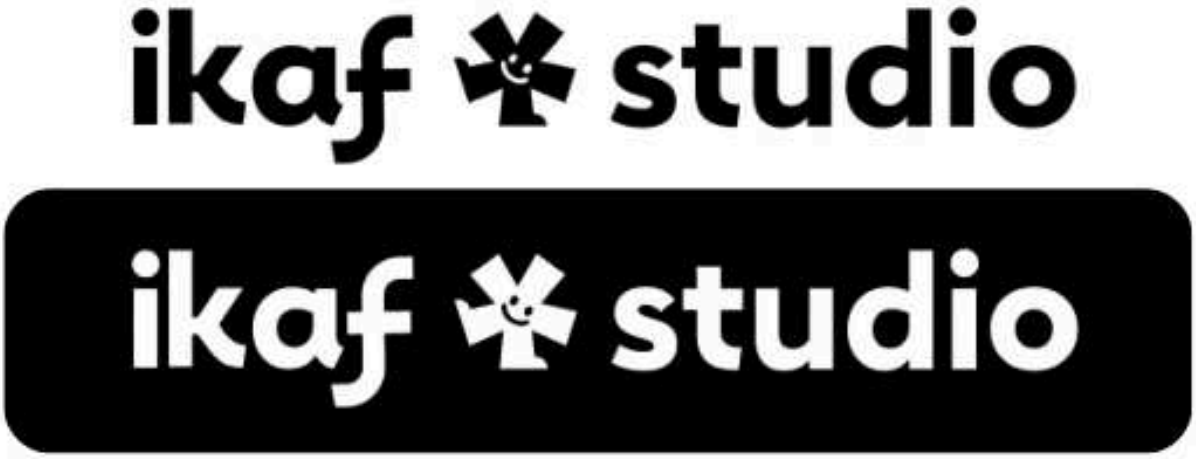

1.4 Logo & logomark

Logo - black and white

main version

secondary version

Logo – color combinations

When applying the logo with some of our color combinations, guarantee that there are good contrast levels between them. The following color pairings are recommended.

Logo - misuses

Don't remove "studio" from the logo

don't stretch or compress the logo

don't flip and/or rotate the logo

Don't use effects

Don't change the font

Don't alter logo spacing and proportions

Don't use it on color background with low contrast

Don't use colors outside of of the color palette

Don't change or ad any element

Don't add gradients

Don't use patterns on the logo

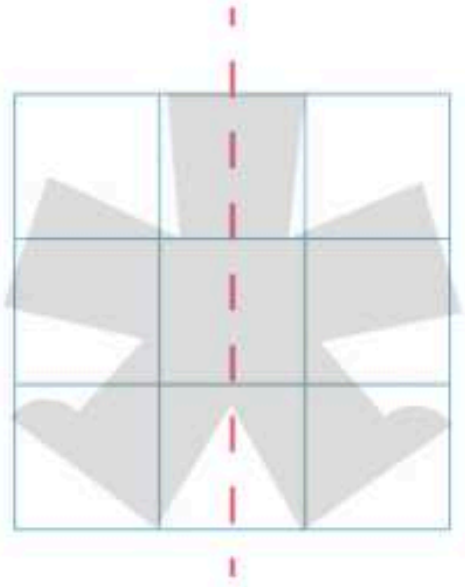

Don't use two colors on the logo at the same time

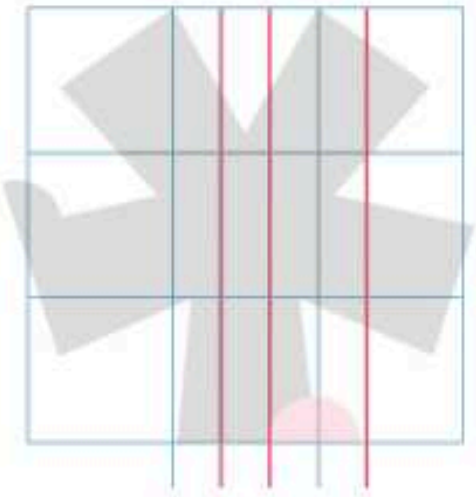

Logomark

Our logomark is a playful design that serves as a compact and recognizable variation of our full logo. Designed for small applications like social media profiles and website icons, it also acts as a friendly mascot, reinforcing our brand identity with a unique and memorable presence.

Our logomark is an alteration of the asterisk present within the main form of the logo. It has a center of symmetry and regular proportions, based on the repetition of the modulus of the width of the final asterisk slat. The height is thus a repetition of three times the width of the "leg". The original asterisk was rotated by 35°, and a semicircle with a diameter equal to 2/3 the width of the leg was added.

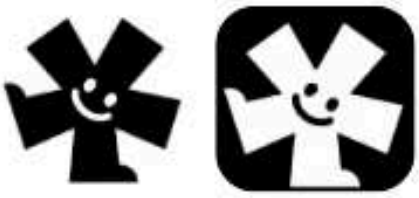

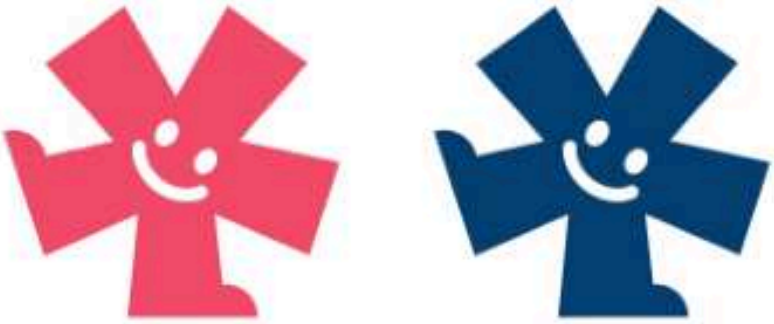

Logomark

When applying the logomark with some of our color combinations, guarantee that there are good contrast levels between them. The following color pairings are recommended.

black & white version

colored version

Logomark – misuses

don't stretch or compress the logo

Don't alter logomark proportions

Don't use effects

Don't change or ad any element

Don't use it on color background with low contrast

Don't add gradients

Don't use two colors on the logo at the same time

Don't use patterns

1.5 Typography

Main Typography

Carnero W04 Bold

THE QUICK BROWN FOX JUMPS OVER THE LAZY DOG
The quick brown fox jumps over the lazy dog
1234567890!"£$%&/()=@#*

Chosen for its strong, distinctive character, this font gives our logo a bold and memorable presence, reinforcing our brand's creative and dynamic identity. It can be used for large headings.

Secondary Typography

DM Sans

light
THE QUICK BROWN FOX JUMPS OVER THE LAZY DOG
The quick brown fox jumps over the lazy dog
1234567890!"£$%&/()=@#*

regular
THE QUICK BROWN FOX JUMPS OVER THE LAZY DOG
The quick brown fox jumps over the lazy dog
1234567890!"£$%&/()=@#*

medium
THE QUICK BROWN FOX JUMPS OVER THE LAZY DOG
The quick brown fox jumps over the lazy dog
1234567890!"£$%&/()=@#*

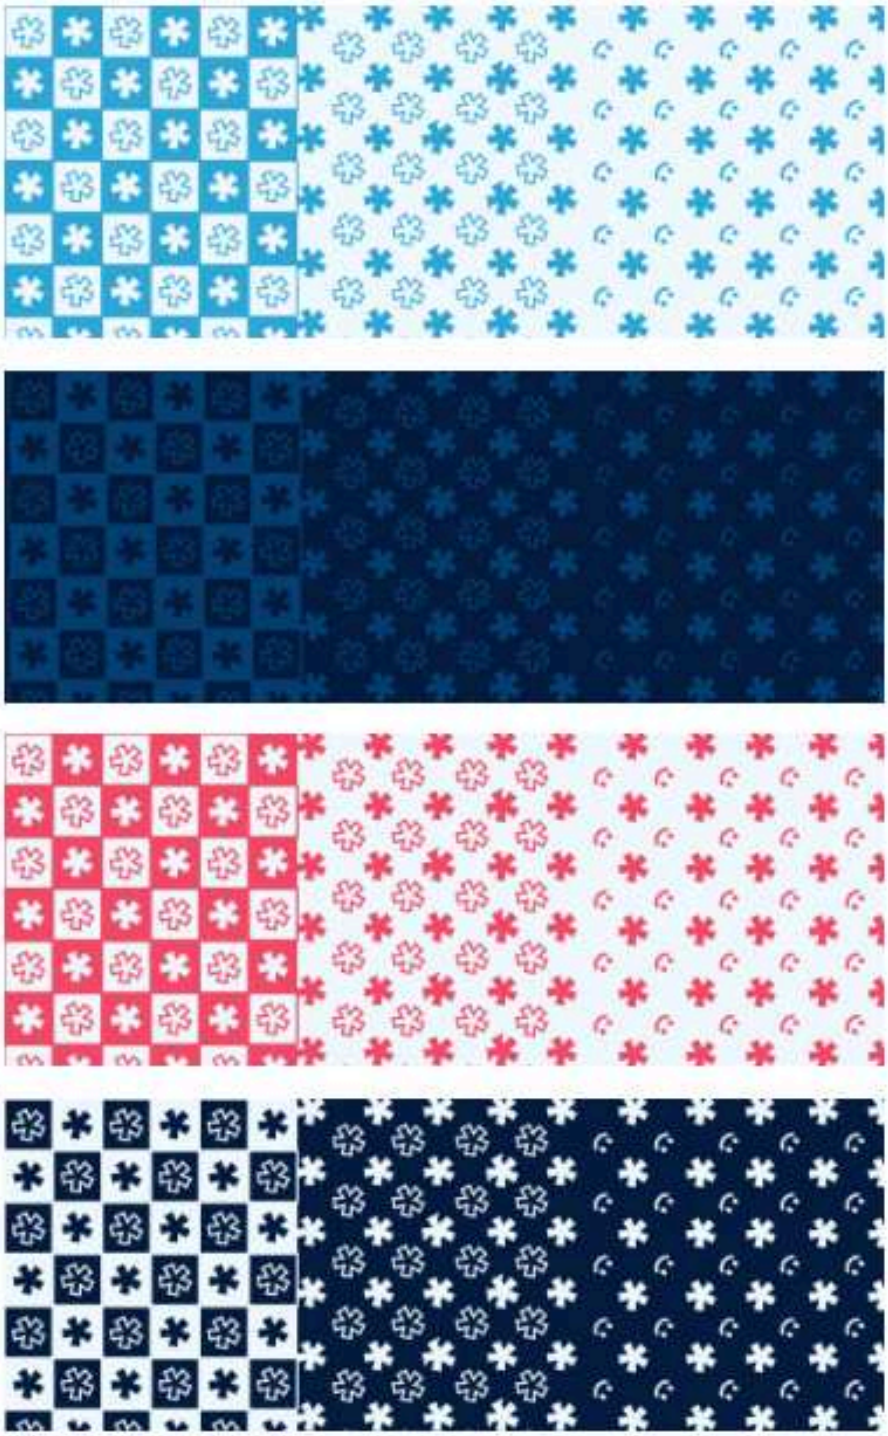

bold
THE QUICK BROWN FOX JUMPS OVER THE LAZY DOG
The quick brown fox jumps over the lazy dog
1234567890!"£$%&/()=@#*

Selected for its modern, approachable style, this secondary font ensures readability across multiple mediums with a clean and contemporary feel. It should be used for subheadings, regular text, small captions, or mostly any other text, varying between light, regular, medium and bold.

1.6 Patterns

Patterns

These are our pattern variations that reflect our playful and dynamic identity. These designs can be used as backgrounds or supporting elements. Colors should stay within the brand palette, and patterns must not be altered or distorted.

1.7 Accessibility

Color palette contrast

In accordance with **WCAG's Success Criterion** 1.4.3 - Contrast (Minimum):
The visual presentation of text and images of text has a contrast ratio of at least **4.5:1**, except for the following:

Large Text
Large-scale text and images of large-scale text have a contrast ratio of at least **3:1**;

Logotypes
Text that is part of a logo or brand name has no contrast requirement.

Incidental
Text or images of text that are part of an inactive user interface component, that are pure decoration, or that are part of a picture that contains significant other visual content, have no contrast requirement.

In accordance with **WCAG's Success Criterion** - 1.4.11 Non-text Contrast:
The visual presentation of the following have a contrast ratio of at least **3:1** against adjacent color(s):

User Interface Components
Visual information required to identify **user interface components** and states, except for inactive components or where the appearance of the component is determined by the user agent and not modified by the author;

Graphical Objects
Parts of **graphics** required to understand the content, except when a particular presentation of graphics is essential to the **information** being conveyed.

Business Model - Analysis

Value Proposition

IKAF* Studio offers flexible and customizable experiences that merge the realms of design and interactive technology. Our scalable service model allows brands, festivals, institutions, and event organizers to receive **projects tailored** precisely to their goals and context. With unique technological capabilities—such as real-time interaction, AR integration, and multi-surface projection—paired with inventive design strategies, we stand apart from conventional providers. By combining **narrative creativity** with **interactive design**, we craft experiences that resonate with users—emotionally, humorously, or both. Every IKAF* project is designed to be visually striking, context-aware, and fully aligned with the client's vision.

Customer Segments

IKAF* Studio's customer base covers valuable **B2B** sectors and **public clients** looking to activate physical spaces through immersive visual storytelling. These include event organizers and cultural producers creating large-scale public activations, as well as marketing agencies and brand managers developing high-impact campaigns for festivals or launches. Cultural institutions like museums and universities engage IKAF* to enhance **educational** and **celebratory** moments, while companies leverage immersive media to create memorable brand experiences.
Public-sector clients such as municipalities and space managers are drawn to projection mapping for creative placemaking and tourism initiatives. Meanwhile, smaller organizations and NGOs looking to amplify public outreach, as well as niche creative communities and design-forward event audiences, also form part of our extended network. To better understand these diverse groups, IKAF* will conduct targeted market research to refine service offerings and guide long-term business growth.

Customer Relationships

IKAF* Studio places strong emphasis on **co-creation and adaptability** when building meaningful relationships with clients through an iterative and collaborative process. We offers after-event services, such as **technical maintenance**, **documentation** and **performance analytics**, ensuring that the experience runs smoothly always, especially for those ongoing. Our clients also have access through us to our curated network of freelance specialists to cover any specific client need. .Alongside this, we also invest on educating and empowering clients with creative workshops and interactive cases studies, exploring the art of design, videomapping and interactive brand activations. This well-rounded approach encourages long-term partnerships with our studio, which we foster with incentives, like priority scheduling and other loyalty-based benefits. This commitment to cherishing our customer relationships through personalized, flexible, reliable work allows clients to feel fully supported, granting our brand credibility.

Key Partners

IKAF* Studio thrives on a **collaborative environment** that extends beyond its core team, creating a flexible and scalable structure. The studio partners with a **curated network of freelancers**, ensuring access to specialized skills in 3D animation, light effects, sound, and any specific project requirements. These collaborations allow for adaptability in project scope and quality in execution. Equipment rental companies play a fundamental role in securing high-quality projectors, servers, and lighting setups tailored to each activation. Even though we own some great equipment, the need for different types can be met through them. Cultural institutions and government entities act as key partners, commissioning large-scale projects that enhance public engagement and heritage storytelling. All our key partners play an important role in guaranteeing that we, as a creative studio, can offer our clients all that they might need to make astonishing experiences for their brands and institutions.

Key Activities

At the heart of IKAF* Studio is the ability to **transform spaces through immersive videomapping** and interactive brand storytelling. Concept development is the first major step, where artistic direction, visual style, and narrative structure are defined. In this way, our studio directs our work to a thriving and ever-growing sector of festival brand activations with artistry and skill, while been able to cover other design and **technology-oriented** areas, as listed in our canvas.

Key Resources

IKAF* Studio's ability to deliver high-quality immersive experiences is reliant on fundamental resource: **human capital, technology, and creative assets**. A **diverse-skilled team** composed of designers and creative technologists form the backbone of the studio. Our studio infrastructure and **technological softwares** including quality projection equipments allow us to create astonishing projects. Also, the studio's strong **freelance network** serves as an invaluable resource, providing connections to specialized professionals, who provide aid in projects with specific requirements.

Channels

IKAF* Studio employs a variety of directions in which we can connect and acquire new clients. **Digital platforms** play a key role, with a focus on social media content, video showcases, and an interactive website featuring past projects and brand portfolio work, as well as behind-the-scenes insights, all convey to potential clients the quality of our work, as well as our work method and ethic. Attendance at **industry events, creative festivals, and design fairs** serves as a crucial channel for direct networking and project acquisition. Strategic partnerships with agencies and event planners act as another avenue, ensuring access to events and public installations. Additionally, **word-of-mouth marketing**, strengthened by the studio's track record, generates valuable referrals and repeat collaborations. By integrating these physical and digital approaches, we are able to gain visibility and become accessible to potential clients.

Cost Structure

IKAF* Studio operates on a mixed cost model that accounts for fixed with variable project expenses and occasional strategic purchases. **Fixed costs** include team salaries, studio rent, software subscriptions, and essential utilities, along with expenses tied to maintaining our freelancer network platform. These cover the baseline costs for our company's continuity. Our **variable costs** fluctuate based on project size and complexity. These include equipment rental, transport, licensing, and fabrication of client-specific merchandise. High-cost labor such as lighting technicians, projection mapping experts, and AV professionals—critical for successful large-scale activations—are considered into **per-project budgeting**. In these cases, scalability plays a crucial role, allowing us to tailor project teams and scope to match the client's budget without compromising quality. We are also accounting for one-time investments in quality projection gear, computers, sound systems, and display units as long-term infrastructure. With this in mind, we consider a variable and contingent cost of recurring maintenance and upgrades that these technologies can require. This flexible cost structure allows us to optimize resources and maintain profitability while ensuring each project receives the creative and technical attention it deserves.

Revenue Streams

IKAF* Studio's revenue follows a project-based model, where pricing depends on specific criteria, like the complexity, scale, equipment needs and additional high-cost labor needs of each project. Revenue streams include all our main activities and are composed of specific and customizable task groups.

Each of these services is priced according to factors like project size, revisions, and the need for additional equipment, such as rentals or purchases. For **videomapping** and similar projects, the pricing accounts for each production stage like content creation, UV mapping, and final projection tests, with possible adjustments based on whether the client provides their own equipment. **Advertising services** are priced based on the number of meetings, revisions, and deliverables, factoring in the cost of physical content production and advertising space rentals. **Illustrations and concept development** are done with fees based on complexity and revisions, while animations are priced based on length and style. The studio also generates revenue through event and festival partnerships, sharing a portion of the total event revenue based on the number of activations and the complexity of the visual content. Recurring revenue comes from long-term installations, where clients pay an initial retainer and then monthly subscription fees. Additionally, creative workshops and merchandise sales offer supplementary income streams. The overall model balances off of projects with ongoing partnerships, providing a flow of revenue from both individual services and recurring engagements.

1.10 Business Plan

Executive Summary

IKAF* Studio is a new creative collective specializing in immersive videomapping and interactive brand storytelling, we stand out by being able to reach and assist our clients in an amicable and fully comprehensive way. As an all-encompassing and approachable brand, we ensure that our clients always have a friend with them every step of the way. We achieve that by having a flexible team structure combining a strong in-house main team and a curated network of skilled freelancers, who all design and deliver a variety of stunning visual experiences for public spaces, cultural institutions, commercial brands, and festivals. Even though we specialize in creating engaging interactive brand activations within festivals, our services can range from projection-based installations and animated activations to merchandise design and creative workshops. What sets us apart is our commitment to customization and collaborative co-creation. Every one of our projects is creatively tailored to fit the identity, goals, and space of the client, whether it's a festival, museum, or an elevator. We bring in the right mix of skills and perspectives, just like a friend would, making each project feel personal, playful, and meaningful.
Our brand is built on project-based work, package deals for events, and additional income streams from merchandise, creative workshops, and strategic partnerships. We aim to expand by growing long-term client relationships, investing in innovation, and building a recognizable, friendly creative brand that people trust and want to collaborate with, because at IKAF*, you're never doing it alone.

We turn complex into bold and creative with the right **friend** for you every step of the way.

To further develop and illustrate IKAF* Studio's potential as an up-and-coming creative studio, we created an entire business plan, explaining all the details that make up our company. This encompasses explaining throughly our brand vision by including a detailed overview of all our products and services; understanding the market we are inserting ourselves into, along with all our competitors; have a step-by-step strategic plan that guides us on everything that should be accomplished before we launch; clearly understand where we stand and where we aim to get to in terms of positioning within our market; have a clear marketing strategy that reflects our brand values and make sure the numbers add up, taking into account for any received starting investments, our expected sales and costs, among other details.

bold

THE QUICK BROWN FOX JUMPS OVER THE LAZY DOG
the quick brown fox jumps over the lazy dog
1234567890!"£$%&/()=@#*

Chosen for its high readability and round shapes, this font is mainly used in context where large paragraphs of text need to be used, as, for example, in digital kiosk.

03 environment & character

Environment & Character

SOS

3.1 Characters

Moodboard

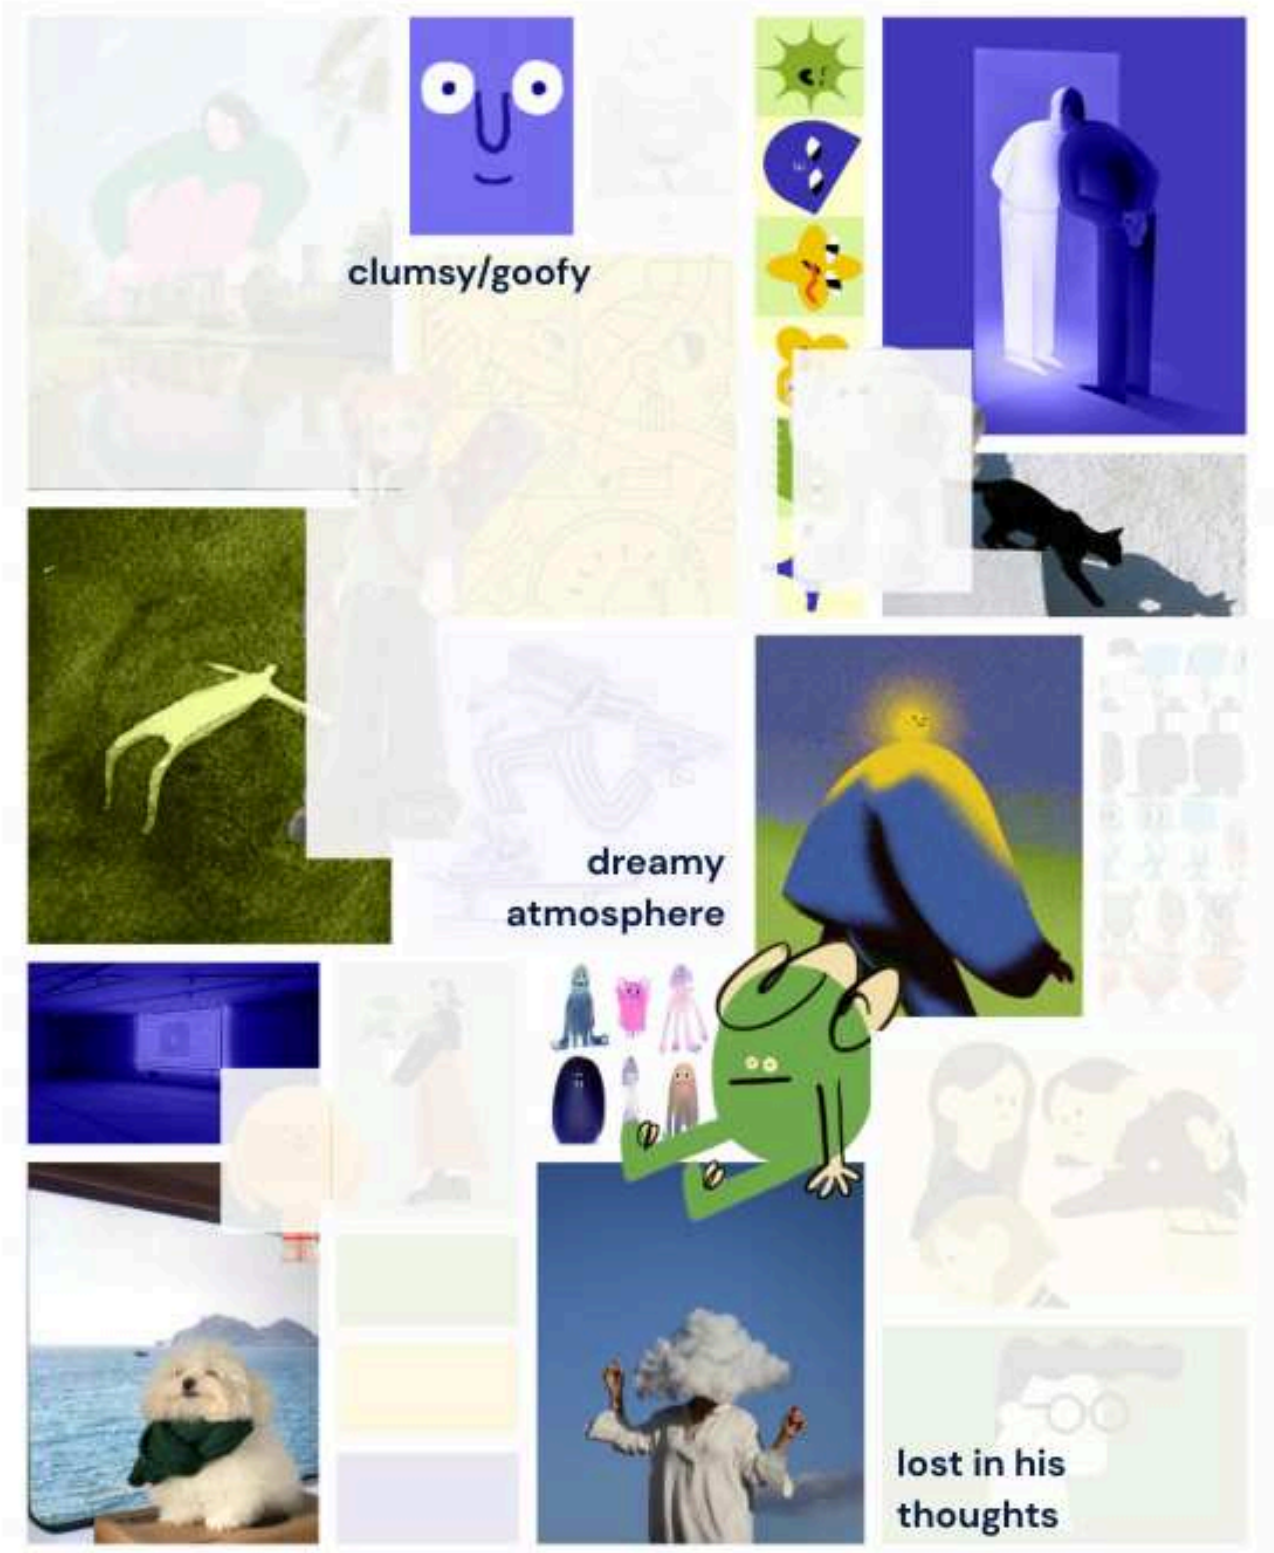

Graphic style

The character in the animation must be a simple character to animate, so we chose to look for simple shapes with clear geometries. The character in the animation will take both 2D and 3D form, so the inspirations for the mood board are various but all consistent with each other.

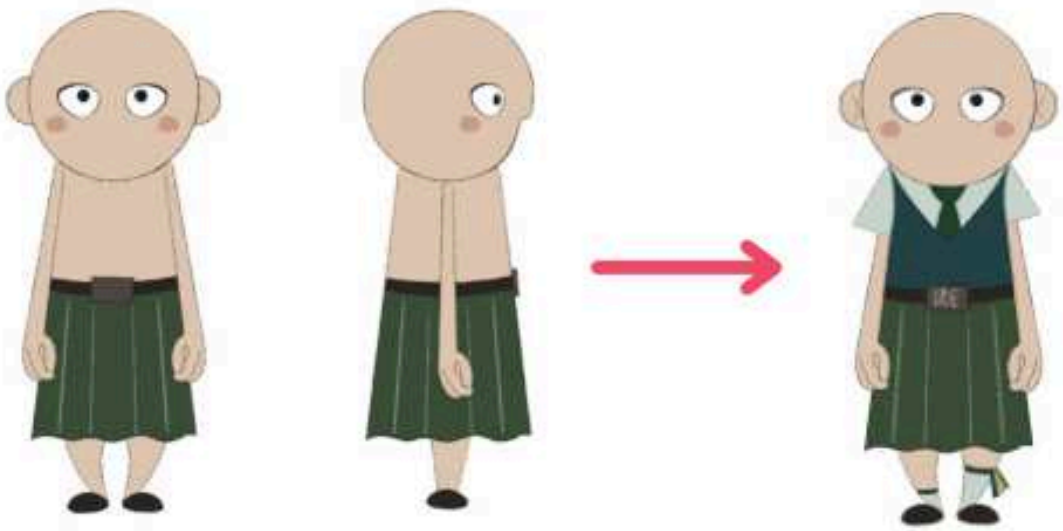

Mood and vibe

The animation character must be one that is **simple** to animate, yet interesting to see and with whom one can identify. The main character has his head in the clouds and is extremely **clumsy**. He is a character who conveys a strong comic connotation, both because of his actions and because of his appearance.

3.2 Characters sketches

Character sketches

The development of Twister began with the creation of a mood board to define their visual identity. Our main goal was to design a character that was simple, geometric, and aesthetically appealing while remaining easily recognizable and relatable.

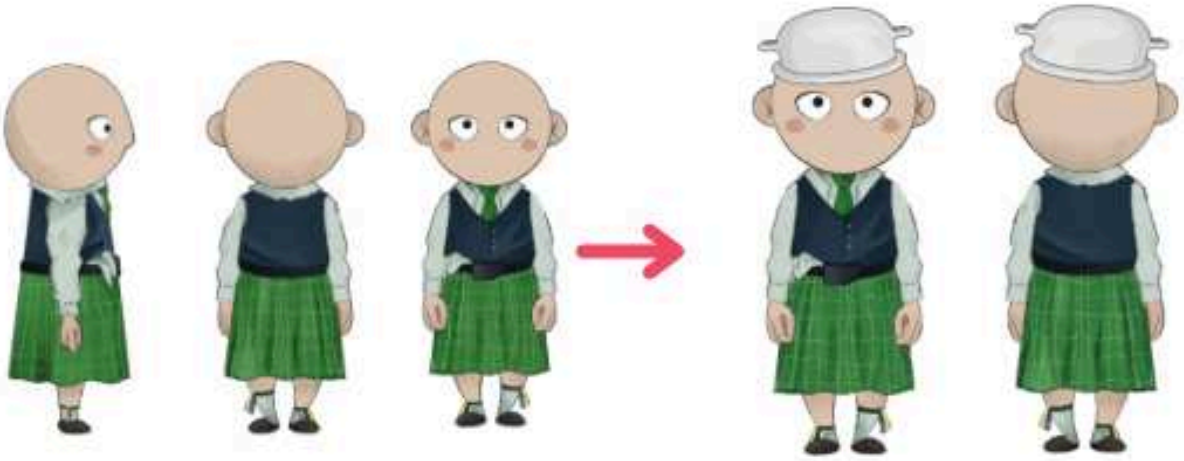

Twister is a genderless character, and their name was chosen to reflect this neutrality, while providing the feeling of confusion and messiness that the animation will bring. We wanted them to feel familiar and universally understandable so that anyone could see a part of themselves in the character.

As Twister is a student at IADE, we incorporated elements of the university's culture into their design. They wear IADE's typical garment, a representation of the IADE community and identity, which emphasize the feeling of belonging and uniqueness, since IADE's outfit is different from more traditional ones. We also included a detail in the socks with one being up and the other crumpled down; a small detail to show his clumsiness and tardiness, which adds to their personality - making them feel more human and endearing.

Overall, Twister's design balances simplicity and cuteness, ensuring they are visually engaging while resonating with a broad audience.

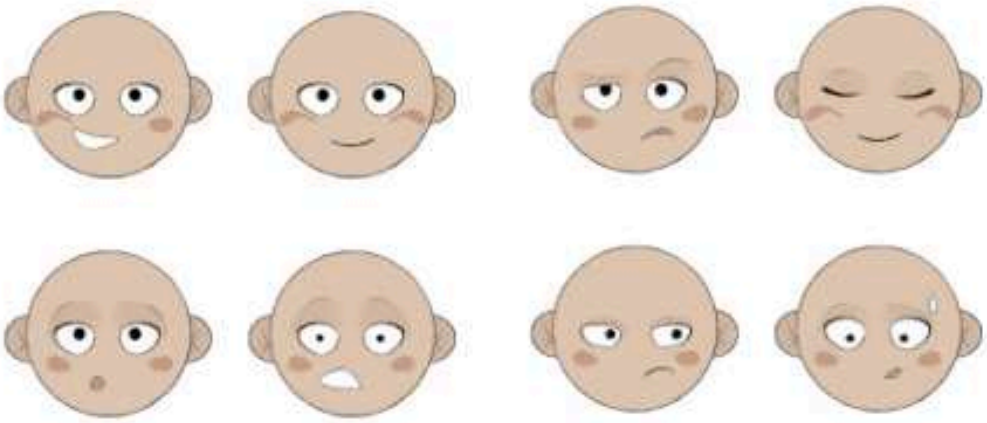

Twister's Concept Art

As part of our preparations for our videomapping show, we've made developments to the main character, Twister, and refinined his concept art by adding details that gave him personality and intricate details that IADE students would be able to relate to.

Twister now features enhanced color palettes, deeper shadows, and intricate details that better express his unique personality. We've also created three distinct versions of Twister, all of which will be showcased on the fifth floor that also went through changes with his new version.

We've developed a full range of facial expressions for Twister and brought him to life in motion.

Character Concept Art

The teacher character — who has Twister leave the Factory — has been carefully designed to reflect her strict personality. She has a rigid posture, striking red hair, and a consistently stern, glum expression that emphasizes her no-nonsense demeanor.

And finally, perhaps most significantly, we've brought Antonio — the founder of IADE — into the world. He will appear on the seventh floor, inside the library, where he speaks to Twister through a television screen.

Character Concept Art

The Tuna characters were designed to represent real IADE students, dressed in the traditional Tuna uniform and carrying a flag. Each character features a warm, welcoming expression, capturing the spirit, pride, and camaraderie of the IADE community.

The IT Guy character was developed to embody a stereotypically cheesy, nerdy persona. He dresses impeccably, always sporting coordinated outfits, and carries an air of mystery. Quiet and reserved, he speaks little but plays a key role behind the scenes — his presence is both intriguing and essential to Twister's journey.

3.3 Environment

Moodboard

Graphic style

For graphic style, we made the choice to use a **3D environment** within which there were **both 2D and 3D characters**, in the style of the cartoon "the amazing world of Gumball."

The 3D environment, reconstructed within Blender, is an environment with simple, low poly or medium poly geometry, in order to optimize rendering and animation export time.

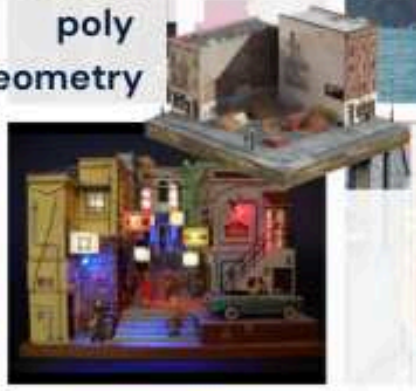

mixed
3d environment
+ 2d and 3d characters

low poly/ medium poly
3d geometry

Architecture and structure

For the scenery, we thought of inserting real architecture within the moodboard that would convey the same impression we want to include in the animation, namely that of an environment that tends to be geometric, characterized by a **surreal atmosphere**.
Considering the presence of the stairs in IADE, we also included images depicting them.

graffiti on the walls

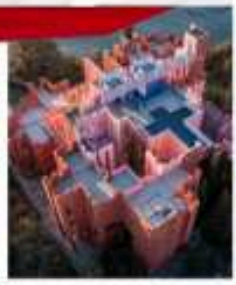

realistic scenario but dreamy atmosphere

Colours and vibes

Regarding the color aspect, when we think of IADE the first colors that come to mind are the primary colors. The atmosphere is **relaxed and creative**, inside the IADE, students' works are displayed, and we can clearly see that creativity is expressed in many different ways.

3.4 Environment Art

Environment sketches (first draft)

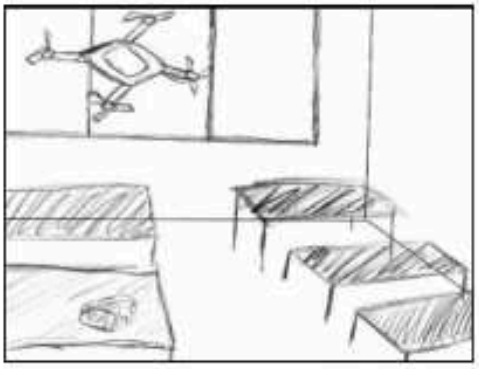

For the environment design, we took inspiration from various areas and rooms within the IADE building, ensurign the there are resemblences to common areas. Some locations were drawn as close to what they are in reality, but others were modified to better align with the needs of the scene.

These sketches serve as base representations that later played a key role in the development of the storyboards. By providing a clearer visual structure, these skecthes helped guide Kateryna in refining the sequences.

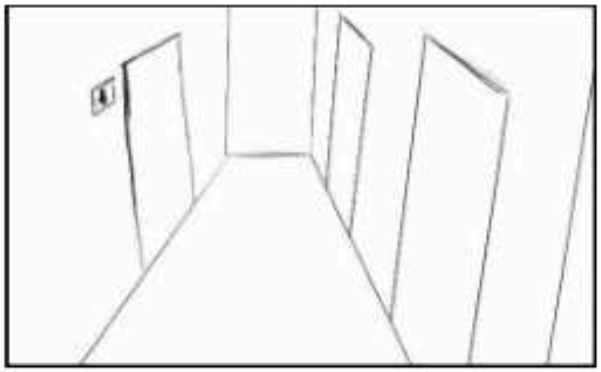

The following selection showcases a few key scenes from the project. While not all environments are included, as some environments were further refined during the storyboard development process.

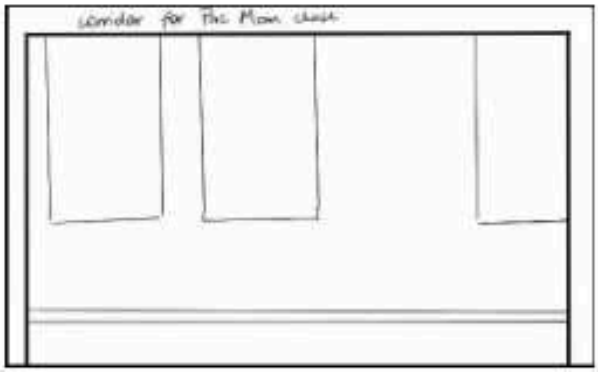

Ground floor with "out of order" elevator.

Tech Lab with drones & VR headsets.

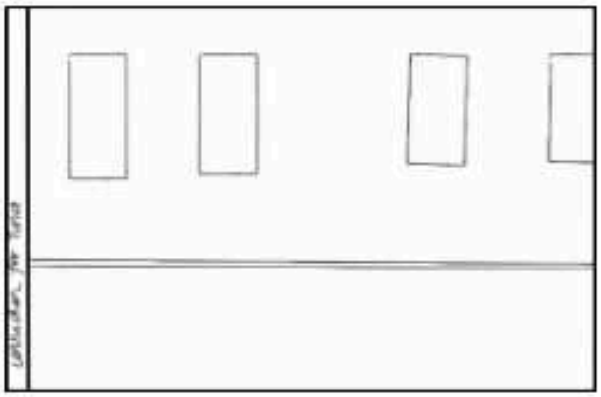

1st floor hallway with bathroom door.

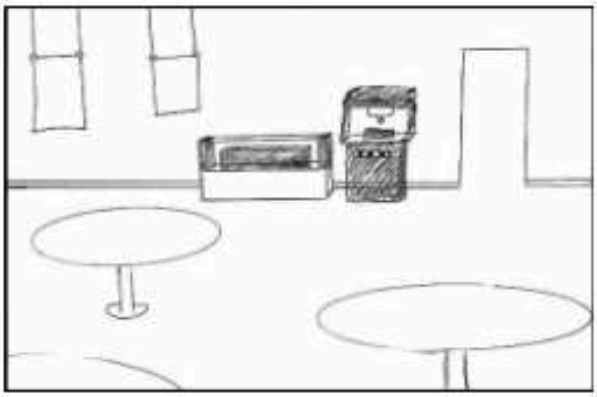

Hallway for Pac-man chase.

Environment sketches (first draft)

Corridor for Tuna Show

Factory with silkscreen printer, but also with 3D printer.

Jungle environment for green screen room.

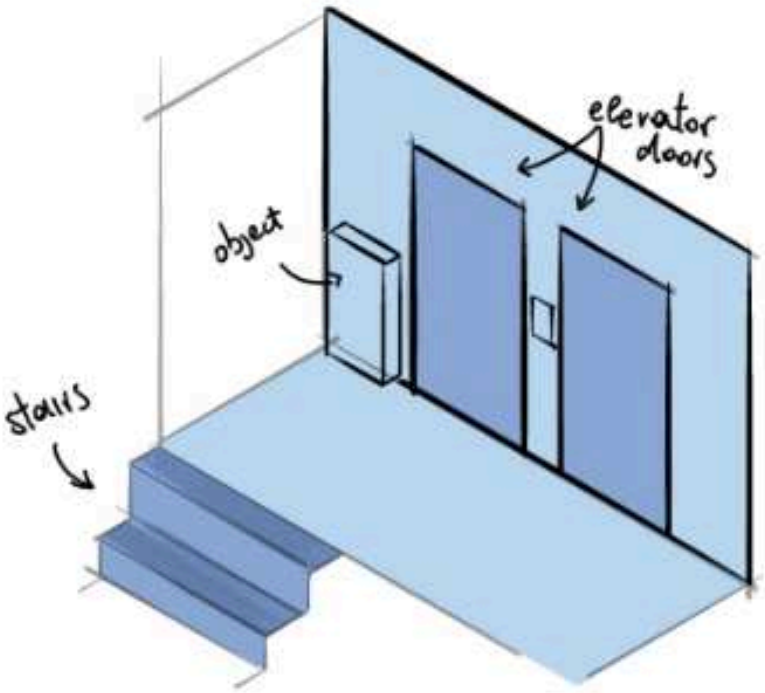

Library haze with books, pages and framed photographs.

Environment Concept Art

From the previous studies regarding the setting, it was found that it is not possible to place images of environments in overly **complex perspectives** on the surface of the elevators, as they would be chaotic and extremely confusing, as well as being difficult to reconstruct in terms of animation and continuity of the landscape.

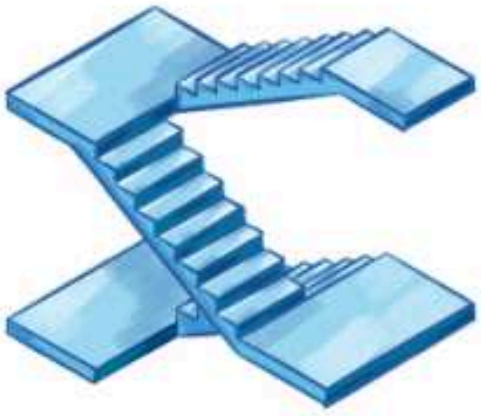

The following studies for the setting were therefore carried out with a view to a "flat" setting, which maintains the characteristics of each floor of the building, but suggests a **frontal** and simplified view of them. The backgrounds and the setting are designed to be reconstructed in **3D**, however, the final view is a two-dimensional "façade" that maintains the three-dimensionality of the references in the moodboard.

04 narrative structure

Narrative Construction

04

4.1 Research

IADE Uniform & TUNA Reseach

In order to root our animation project What The Floor? in the authentic culture of IADE, we conducted informal research focused on university-specific traditions and symbolic student elements. While this was not an exhaustive ethnographic study, we reached out to a member of **TAI** (Tuna Académica do IADE) who is closely involved in both Tuna and the university's wider student life. The goal was to collect insights that could inform **visual references, character designs, and musical moments** in the animation.

The uniform

We began by investigating the distinctive elements of the IADE academic uniform. Unlike the more traditional Portuguese university attire, IADE's uniform notably incorporates a **kilt**, setting it apart with a bold and unconventional design. Our contact highlighted that the uniform can be worn under three distinct motivations—by the **institution**, through **praxe** (the initiation ritual), or as a member of the **Tuna**. In its general composition, the outfit includes a shirt, waistcoat, tie, and navy blazer; paired with the kilt, navy socks, and symbolic tassels ("grelos") in different colors representing course affiliations. While this configuration applies to institutional and praxe representation, members of the tuna adapt this attire with slight modifications.

Tuna's values and their mood

In describing the Tuna Académica do IADE (TAI), the interviewee emphasized its **vibrant spirit** and the familial bonds built through shared musical passion. As a mixed tuna, inclusive of all genders—unlike many traditional gender-exclusive tunas—TAI proudly fosters **diversity** in identity, background, and expression. Members are recognized not only by their distinct outfits but also by custom sweatshirts and t-shirts printed with the Tuna's logo, which are exclusive to official members.

Their joy, diversity, and constant energy are essential traits that we aim to capture through both movement and mood, ensuring the representation feels true to the spirit of IADE's tuna.

Music and show

For the animation sequence that features the tuna on one of the floors, we gathered musical suggestions that reflect the spirit of TAI. **"Clementina"** holds deep meaning for the group, while other playful and lively tunes such as **"Bigodinho," "Ao Sabor do Vento,"** and **"Fado Borrachão"** could offer humorous or energetic background music. These could pair well with the surreal chaos of the stair scene.

Lastly, a key performance detail emerged: TAI integrates simple **choreography** and coordinated steps into their live performances while singing, which adds a dynamic visual rhythm we plan to reflect in the animation.

Organization's structure

TAI functions as a **democratic organization**, led by a Magister who oversees final decisions. The governing structure also includes a creative director, rehearsal leader, secretary, and treasurer. While there are no visual indicators that distinguish the leadership from other members during performances, their coordination plays a vital role in maintaining the tuna's rhythm and cohesion.

The musical structure of the group is segmented into four key sections:

- Front stage: pandeiretas (tambourines) and banners
- Strings: guitars, bass, cavaquinhos, and mandolins
- Percussion: cajón, bongos, crash cymbals, and other small percussive instruments
- Winds: flute and saxophone

Social networks

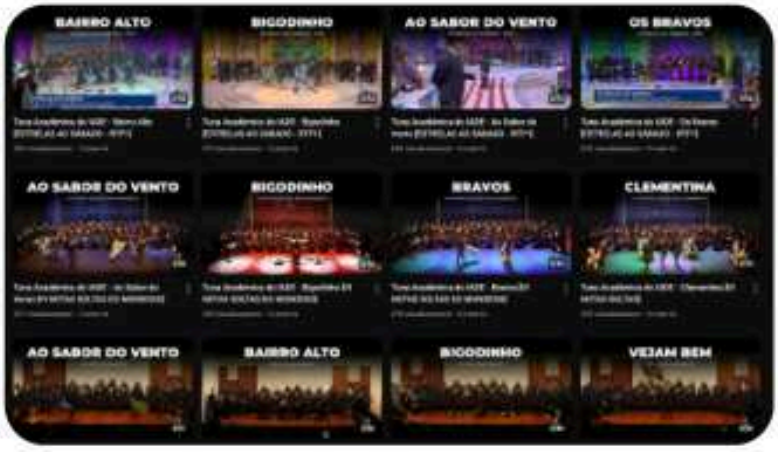

TAI also has an Instagram page, through which the linktree of the various TikTok, Facebook, and YouTube social profiles can be accessed. On the various socials the style is playful, alternating videos of performances with various trends or funny little videos.

On the Spotify page it is possible to listen to the song "**Clementina**," while on YouTube there are videos of numerous other performances.

scan to listen to "Clementina" on Spotify!

4.2 Narrative Framework

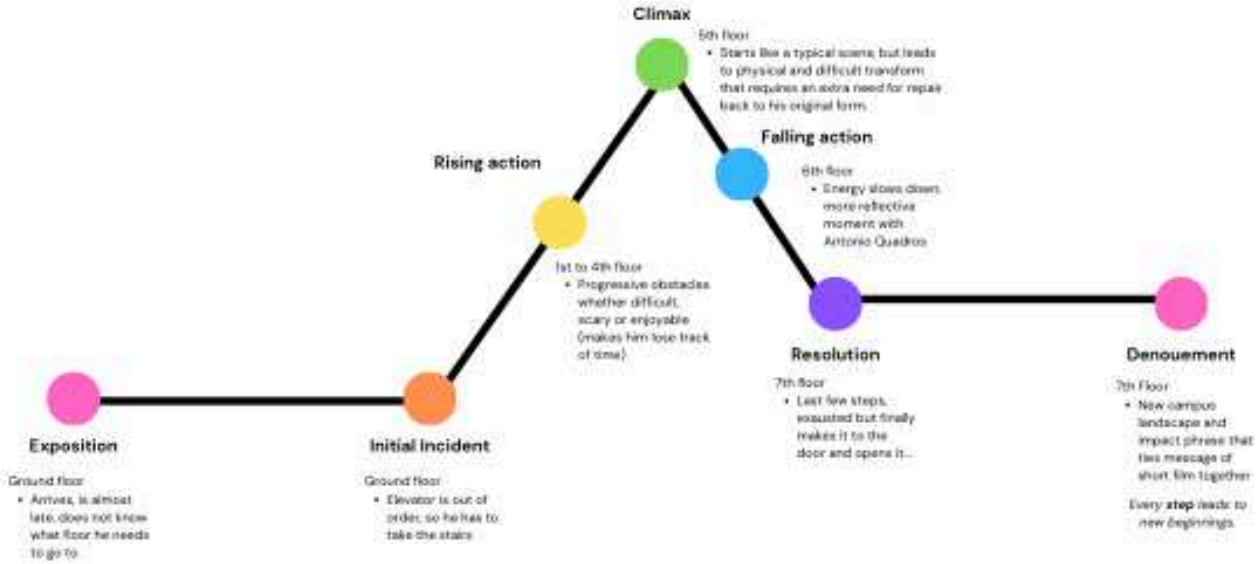

Our short film's narrative was a construction we started from day 1. It first began as an intention of wanting an animation that highlighted important moments and aspects of an IADE student's experience, not only in the university itself but the building. We wanted unique pieces of the our personal experiences to shine through but also other elements that we deemed valuable to other students, which will be explain later. As we enhanced this structure, including elements like a story progression through the long staircase of our building, we began identifying specific characteristics from each floor (including its labs, classrooms or interesting people) that we saw value in adding to our animation in order to create a story with full progression and that made sense.

Our first draft of this had a few narrative holes, but we slowly progressed making it more complete and meaningful.

To achieve this we thought of a striking and heartfelt message of "Every step leads to new beginnings" that fully compiled the progress of our animation through the infinite steps of IADE's stairs and the moving of campus to a new and improved environment. With our general idea set, a solid beginning and end, we saught to improve the obstacles that our character would face before reaching this final goal.

These obstacles started as more "obvious" interactions on each floor but slowly began turning towards a more surreal and humourous direction. This change allowed us to create scenarios that indirectly expressed the details of a shared student experience, without limiting or hindering the our creativity towards the narrative.

To exemplify and facilitate the understanding of the narrative we used a dynamic graph to break down its main points.

The more surreal and uncommon plot also gave us more opportunity and adaptability to adjust our narrative to the complex non-flat surface in which we are going to videomap on. Similarly, this change allows us to play around more with the display of our animation, using the surfaces available to make the story more surreal, without the need for a perfectly or fully realistic environment, which will be better visualized in the following section with the storyboards.

Below you will find a full structure of our narrative with some detailed descriptions of what will happen in each part (floor) and how that will progress through to the next one.

ikaf studio presents...*

What the floor?

Protagonist name: Twister

Introduction (Ground Floor)

- Twister rushes into the university, checks the time, and realizes they're late and has no idea where the class is located.
- Heading towards the elevators, they find them out of order and quickly turn to the stairs.

First Floor - Tech Lab & Pac-Man chase

- Twister walks down the hall, peeking into the classroom to see if he can find the right one.
- One classroom reveals the tech lab, filled with VR glasses, drones, and other equipment. Realizing it's not the right class, they turn back to the corridor towards the stairs.
- Near the bathroom, they suddenly see a Pac-Man character emerge. The Pac-Man chases them down the hall until they reach the stairs, where they find safety.
- The Pac-Man reference connects to the "decoration" inside the first-floor bathrooms.

Second Floor - TUNA show

- The hallway is filled with TUNA members practicing.
- Twister tries to navigate through but gets caught in an impromptu jam session. Band members enthusiastically block their path.
- The whole scene is turned into a compilation of TUNA member's playing each of their instruments around the environment.
- This scene showcases TUNA's energy and IADE's spirit, with lively music and dancing.
- Twister gets caught up in the joy but snaps back to reality as the music fades, continuing the search.

Third Floor – The Factory

- Twister enters the factory space and sees a class in progress. The professor roams among students working in groups.
- When the professor notices Twister standing at the door, they sternly tell them to get to class.
- Startled, Twister stumbles backward, landing on a silkscreen printer, which transforms them from 3D to 2D.
- Confused but fascinated, they examine their hands before rushing back up the stairs.

Fourth Floor – Green Screen Room

- Reaching the fourth floor, Twister stumbles, falling into what appears to be mud. Splashes spread across the walls and elevators.
- They turn on the light (pressing the elevator buttons), revealing a lush tropical rainforest.
- Birds fly overhead as Twister looks around in shock.
- They spot a mini-map and pull a handle, causing the environment to shift back into the green screen studio.
- Relieved, they quickly continue up the stairs.

Fifth Floor – Sketch Room & IT

- Peeking into a classroom, Twister is suddenly pulled inside.
- The scene shifts—they are now on a drawing model stand, where students are sketching them in different styles.
- With each stroke, their appearance physically changes—some drawings make them muscular, others give them hats, or even distort their shape like a Picasso painting.
- Dazed and now in a deformed 2D form, they struggle to move and seek help.
- They head to the IT room, where a student uses a computer and a blueprint of Twister to restore their appearance back to 3D.
- Feeling relieved, they continue upwards.

Sixth Floor – Library Haze

- The library is filled with floating pages and digital screens displaying IADE's history, yearbook photos, and nostalgic moments.
- Twister is momentarily swept into a whirlwind of knowledge, overwhelmed by the surrounding imagery.
- A retro TV plays a video of Antonio Quadros, IADE's founder, who appears to address Twister directly.
- Quadros asks why they are there. Twister responds that they can't find their classroom.
- Quadros tries to explain that their classroom is no longer here—it has moved to the new campus—but a librarian appears, shushing them with a dramatic "SHHH" typography.
- Twister, startled, waves goodbye to Quadros and hurries up the final flight of stairs.

Seventh Floor – The Final Steps

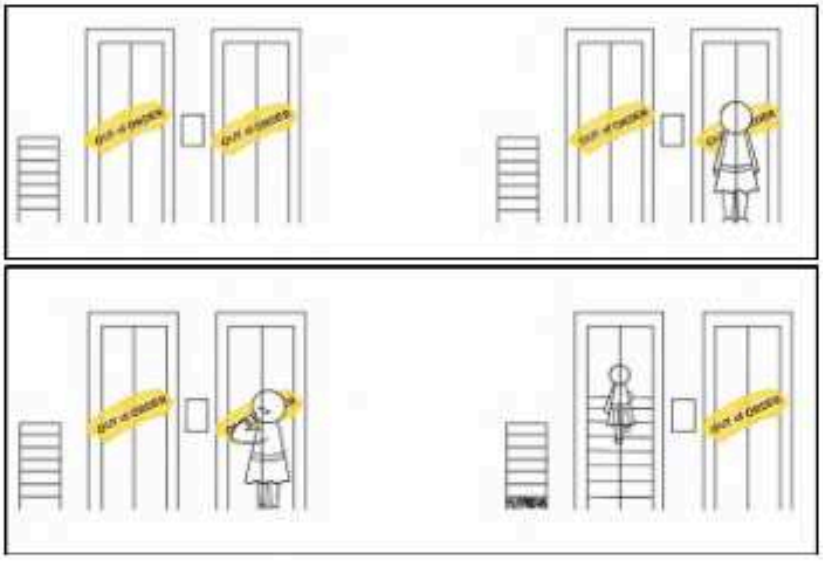

- The last staircase looms ahead. The tension builds as exhaustion sets in.
- Each step is heavy, their feet dragging as they push forward.
- They finally reach the top, pausing in front of the final classroom door, breathless.
- Slowly opening it, light floods through the entrance.
- The scene transitions—the object in front of them shifts from the old building into the new campus landscape.
- Twister looks on, surprised yet reflective, a faint smile appearing.
- The final message fades in: "Every Step Leads to New Beginnings."
- The text dissolves softly, leaving behind a mix of nostalgia and inspiration.

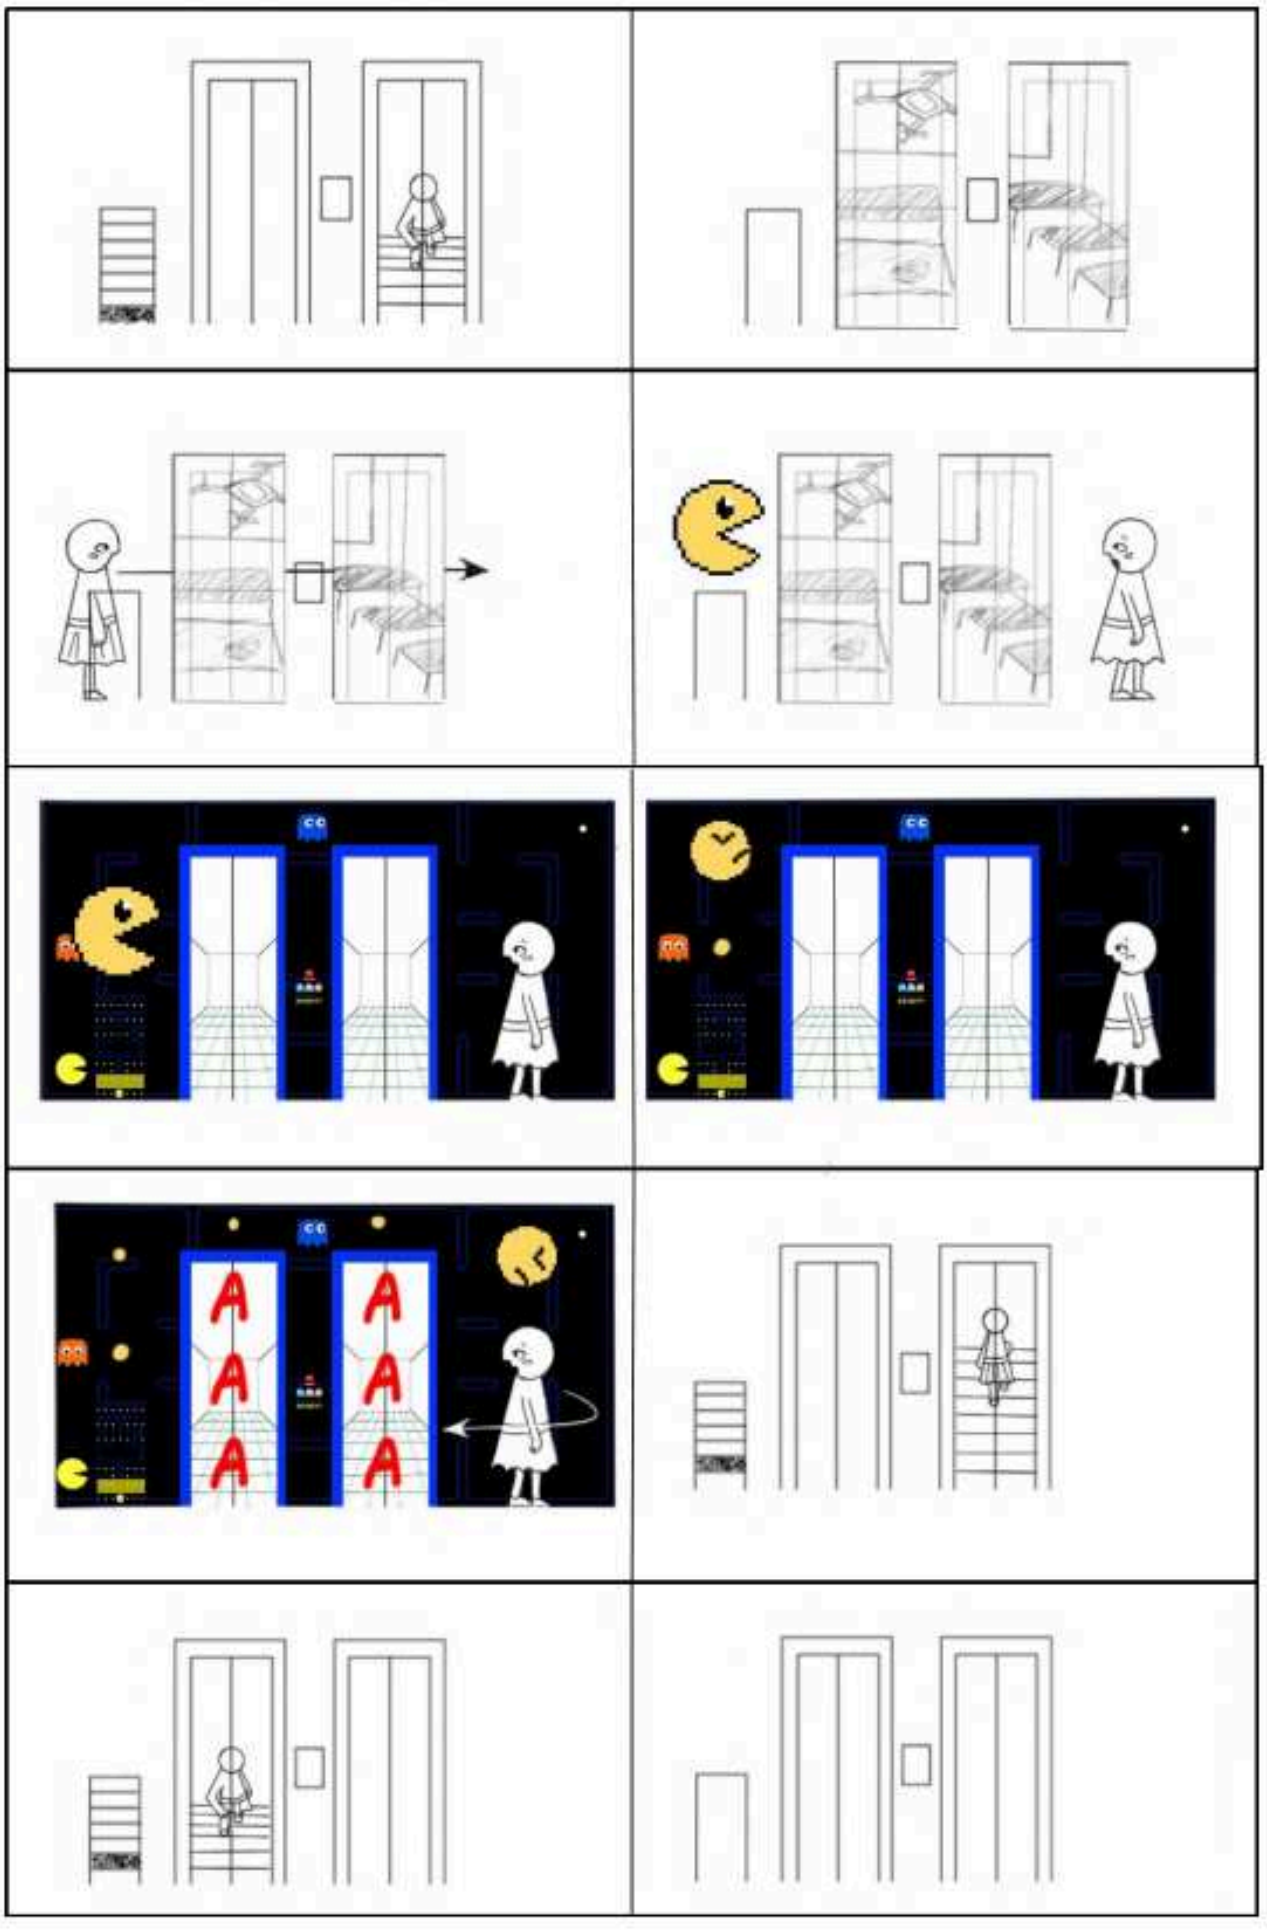

4.3 Storyboard

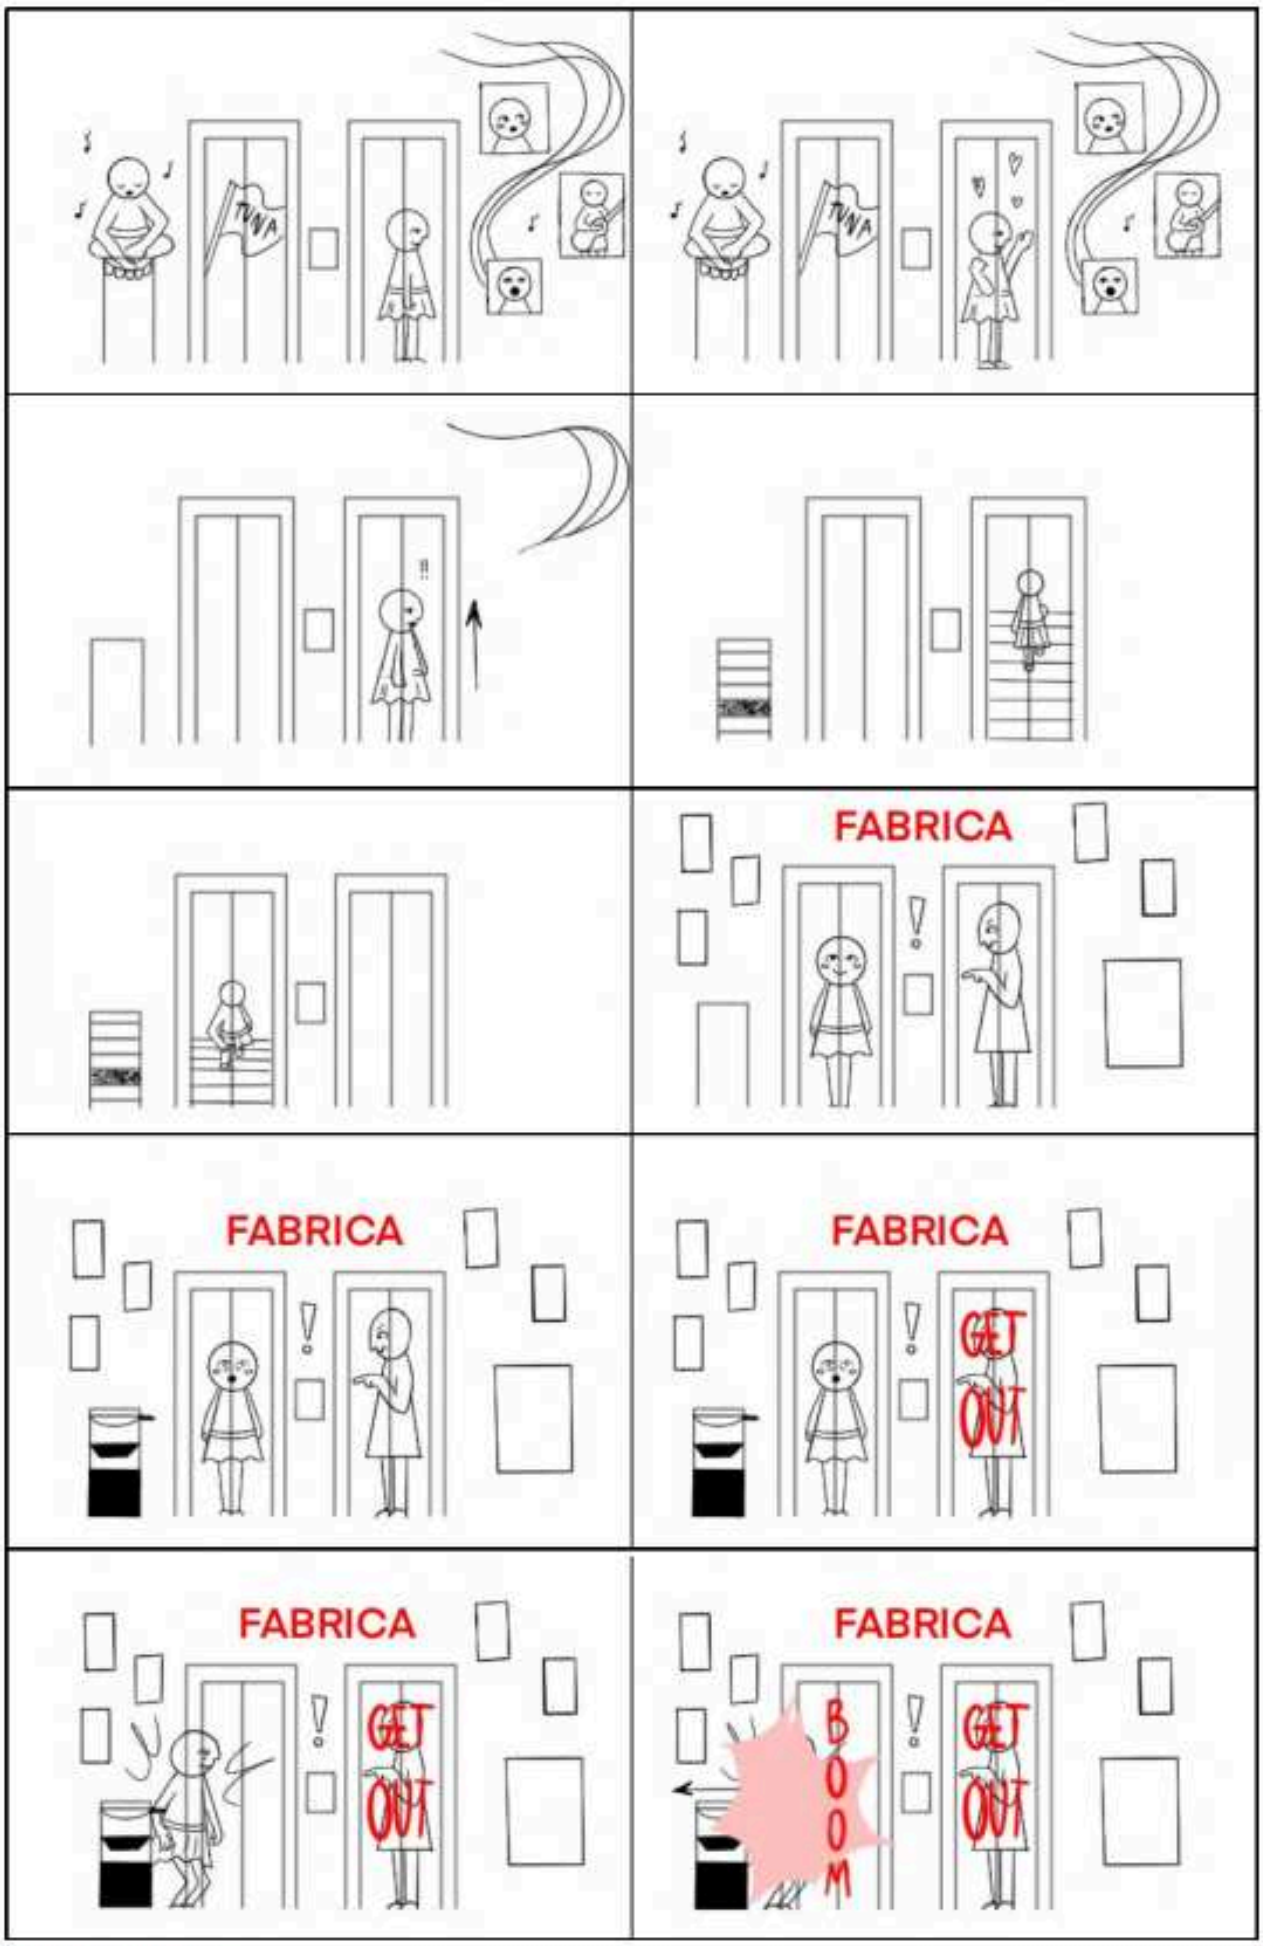

The primary objective of developing the storyboards was to determine the placement of characters and the environment while ensuring that the animation would be visually engaging. The first storyboard was designed as a simple representation of the story, making it clear and understandable for a wide audience. It provided a general overview of the narrative and helped establish the foundation for the animation. The second storyboard was more detailed and specific. We dedicated a significant amount of time to discussing the storyline, characters, and environment, carefully considering how each element would be positioned within our video mapping scenery.

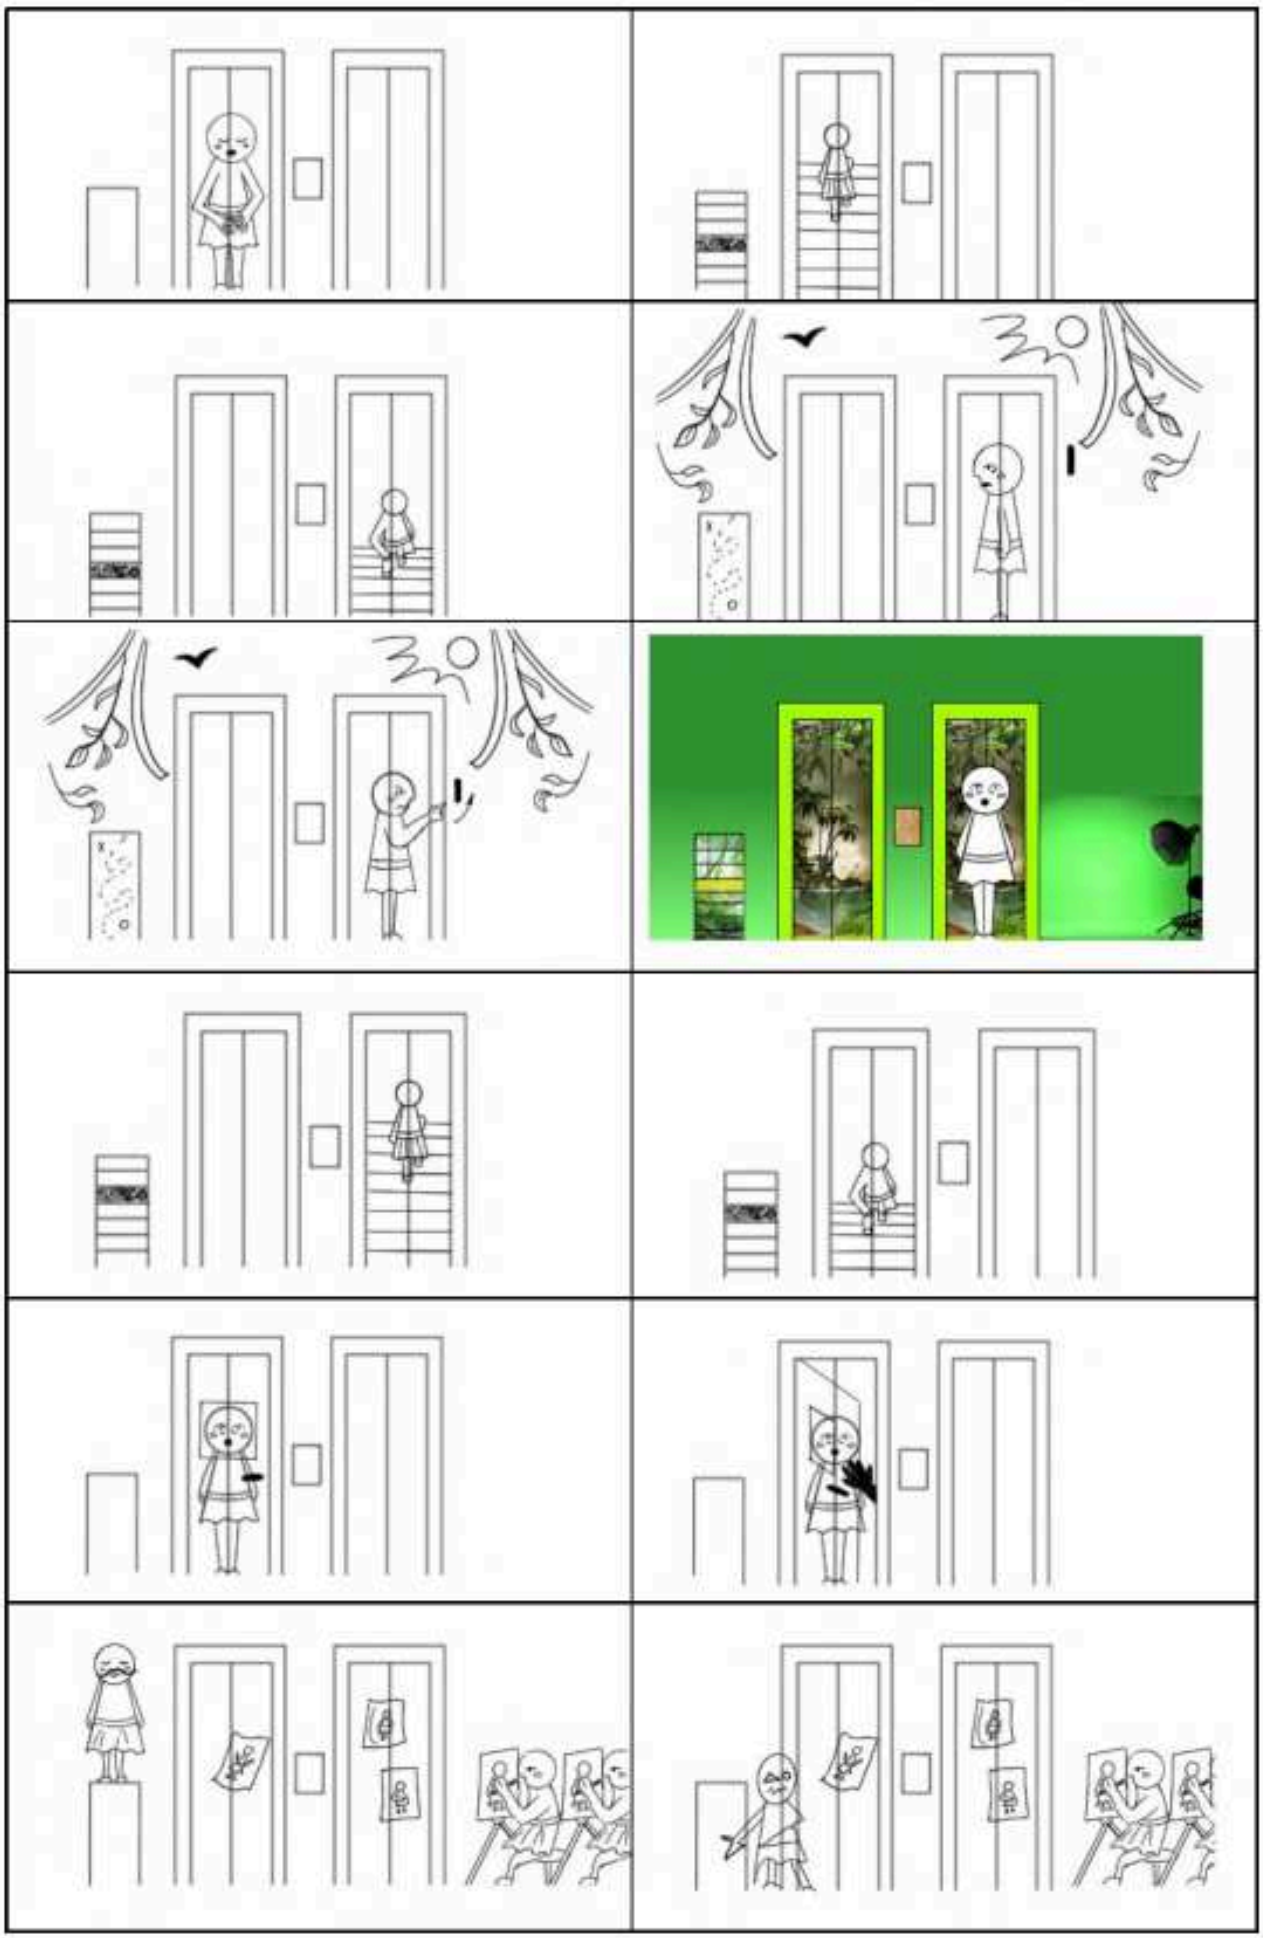

This included the object's surfaces, walls, and elevator doors, ensuring that the animation would align effectively with the mapped structures.

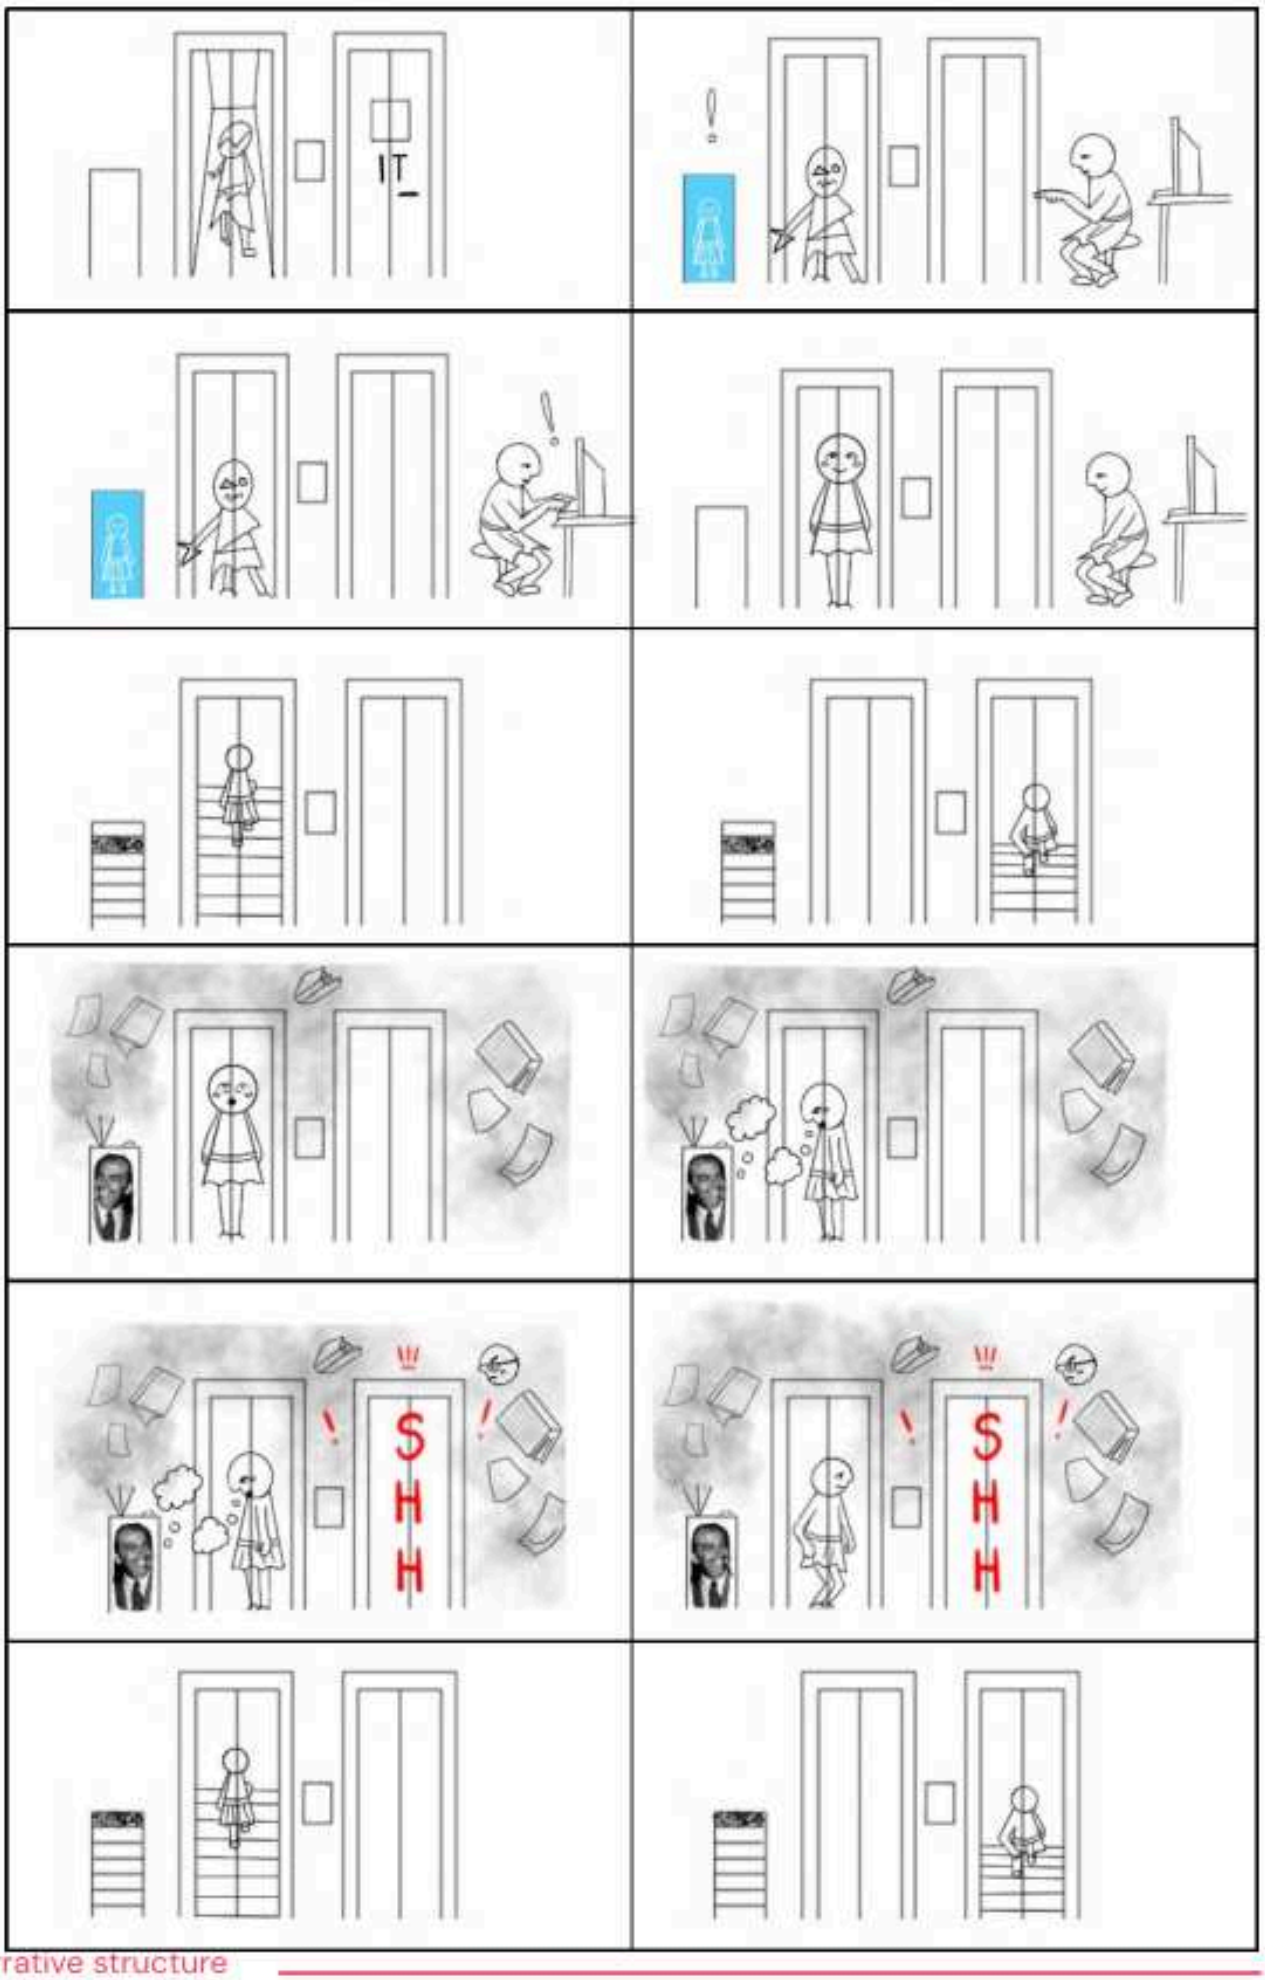

Once the planning phase was complete, we proceeded with the drawing process, focusing on incorporating specific details into the scenery. This step allowed us to refine the visual composition and enhance the overall impact of the animation. Through this iterative process, we ensured that both storyboards served as valuable guides for the final video mapping show.

Using these storyboards as images, we created a very simplistic animatic to showcase and give us some guiding structure as to how our narrative could be transformed into an animation. This was made using static drawings, which were moved and adjusted to resemble some movement. The following link will lead you to a Google Drive folder where you can access this short and rough version of our animatic.

Link: https://drive.google.com/drive/folders/1GwcgB7IdEVBwVNOI6TPgfQxTdUaVwesK?usp=sharing

4.4 3D assets

3D assets Development

In order to make our animation come to life, we developed, as predicted in our moodboards, 3D models of our environments and characters so that we could later animate. To do this we used Blender and, for some specific sets, Unreal.

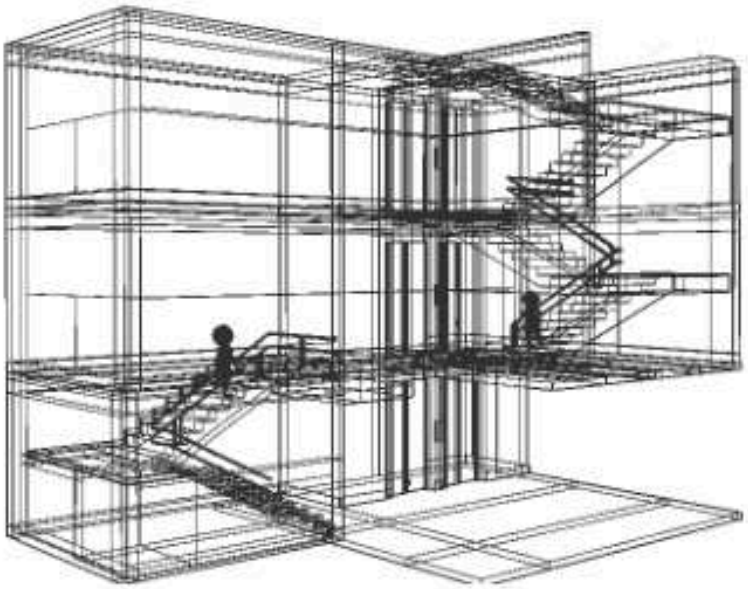

Below, you will find a variety of renders for each floor's environment, and Twister's character model. Momentarily for the other characters, we utilized a general human shaped character that will later to enhanced to look as the concept art showcases.

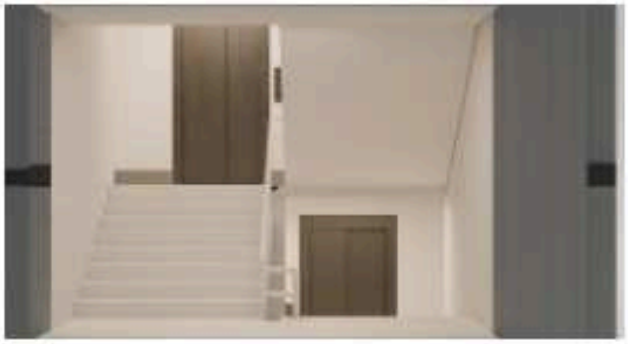

3D model renders

All 3D models shown here were created by Ikaf* Studio using Blender. We focus on delivering high quality work through a solid mix of creativity and technical skill.

With careful attention to detail and real world measurements, we partially modeled the staircase of IADE as part of the project. An important location for our animation

4.5 Short Story Prototype

With some 3D models made, all still in refinement phases, we advanced to combining these into an actual animation that could represent the narrative development of our short story. For that we created inidividual animations for each environment model and, later combined them into one full animation. With the full animation (some with placeholder assets), we were able to adjust any potential confusing scenes, adding proper transitions to them.

We will use different **types of shots** to express various scenes, emotions, and actions. The plan is as follows:

1. Wide Shots
- Use: To show the overall environment of each floor (e.g., floating books in the library, VR equipment in the tech lab).
- Purpose:
  - Help the audience quickly understand the space layout.
  - Establish a visual baseline for the surreal events that follow.

2. Tracking Shots
- Use: For transitions between staircases and during the Pac-Man chase.
- Purpose:
  - Maintain continuity of movement.
  - Smoothly connect different environment models.

3. Dutch Angle
- Use: During scenes like the 3D printer transformation and TUNA band performance.
- Purpose:
  - Enhance the surreal feeling and sense of imbalance.
  - Reflect the protagonist's emotional state.

4. Close-Ups
- Use: On details like the watch showing "late," the professor's shouting mouth, IT staff typing on the keyboard, and Antonio Quadros' hologram.
- Purpose:
  - Highlight key narrative elements.
  - Direct the audience's focus and compensate for placeholder asset details.

With that, we were also able to incorporate **sound effects and background music** to intensify the narrative effects and convey more emotion, even with a prototype with room for further refinements.

With this link you are able to access a Google Drive Folder, where the **full video** prototype is available to watch.

Sound Effects: Short Film & Teaser

In What the Floor, sound plays a strategic and expressive role in enhancing the overall narrative experience. Rather than functioning merely as an accompaniment to the visuals, the sound design is conceived as a narrative element in itself — shaping atmosphere, guiding emotional tone, and adding depth to each scene.

Sensory feedback sounds, such as footsteps, climbing stairs, and doors closing, reinforce the sense of movement and progress. Subtle details, like the hum of a 3D printer or the clicks from IT service interactions, enhance realism, deepening the connection between the character and their environment. To build a sense of tension and immersion, ambient sounds are carefully used throughout the narrative. Creating tension to amplify the urgency and emotion of the scenes.

All sounds used in the project were sourced from freesound.org, which provides royalty-free sounds under a Creative Commons license. Additionally, another key sound element was sourced from SoundCloud.

Our Animation Teaser was focused on attempting to transmit the chaotic vibe that Twister has throughout the story. For that, we decided to add a few sound effects to make the Teaser more engaging for our audience, however without exaggerating as we don't have the final movie ready, and we want to make the it coherent with the movie's sound effects.

The theme song "It's the End of the World as We Know It" by R.E.M. was chosen for its energetic and chaotic vibe, reflecting Twister's fast-paced, unpredictable journey.

All the sound effects / background music utilized in the teaser were obtained from YouTube. All the links will be provided down below:

- **Initial Background Song:** https://www.youtube.com/watch?v=qQE1yJAoSYY&list=PLS5-eQASSN9z-PtFWaH1O6M6brZlbbJDT&index=6

4.6 Teaser and Trailer

Teaser Screenshots

The Animation Teaser can be accessed through the following Google Drive link:
https://drive.google.com/drive/folders/1LGaV6WO7qiX57rDc4K-pjmbRpDJL6ont

Final WTF? Trailer

The What the Floor trailer is a 45-second, surreal, humorous, and fast-paced teaser designed to immerse the audience in the film's chaotic atmosphere without revealing key plot points. It follows the main character, Twister, who arrives late and finds the elevators broken, forcing him to take the stairs. From that moment on, his journey spirals into a bizarre and unpredictable sequence of increasingly strange floors.

The narrative in the trailer is intentionally non-linear, reflecting the absurd tone of the film. To preserve the surprise of the full story, several scenes were created exclusively for the trailer, allowing it to convey the energy and style of the film without giving away spoilers. On-screen texts appear throughout the trailer to engage the audience directly and add layers to the story, blending humor with mystery.

Sound design sets the mood from the beginning, with a muffled school bell and faint static over a black screen. The music—"It's the End of the World as We Know It" by R.E.M.—starts subtly in the second shot and grows more intense, mirroring the trailer's increasing rhythm and chaos.

The visuals take Twister through surreal staircases, a Pac-Man-inspired sequence, a tuna-covered floor, and even a seemingly peaceful jungle that quickly becomes absurd. The trailer closes with Twister running through the IADE building in an unusual and unexpected way, ending with the line: "Running through IADE but like, weird."

Here is the link for access the full trailer:
https://drive.google.com/drive/folders/1h5uHmVefJaOUMKxH4EM4R3LoXBZCxcI6?usp=sharing

05 projection studies

Projection Studies

05

5.1 Research

Why are we making our animation?

Our animation connects to **IADE's culture**-its founding story, the TUNA student band tradition, and the vision for our new campus. It showcases **IADE's technical environment** like 2d 3d and printer, and uses nostalgic design elements like classrooms and professors to **connect the emotion**.

But ultimately, **we're creating content**, stories that build empathy and interaction. Why does content matter?

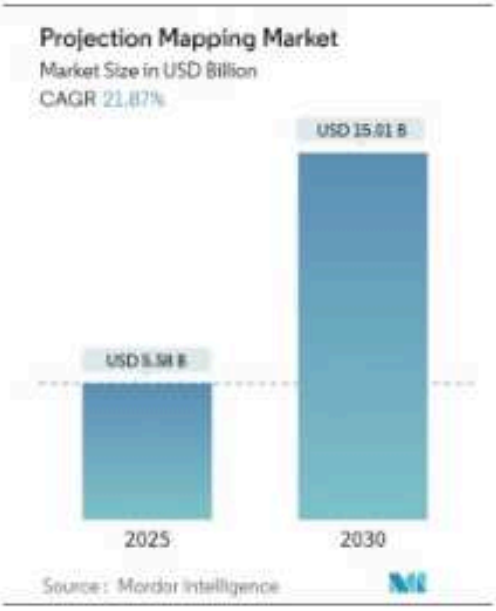

This leads to the bigger question: Why use video mapping?

Why use video mapping?

Traditional screens require dedicated spaces and physical setups. People must gather in specific places to watch. But video mapping **transforms any surface into a screen**. It's visually stunning, and **highly shareable**.

With great content and video mapping, today we tell stories on an elevator wall. Tomorrow--on buildings and surfaces everywhere. This is how we'll share IADE's spirit with the world.

Video mapping market outlook

There is a greater need for business goods and services during times of economic expansion. Businesses frequently invest in technology like projection mapping solutions that can increase visual efficiency as a result of this increase in demand for entertainment.

5.2 Projection

Blueprint

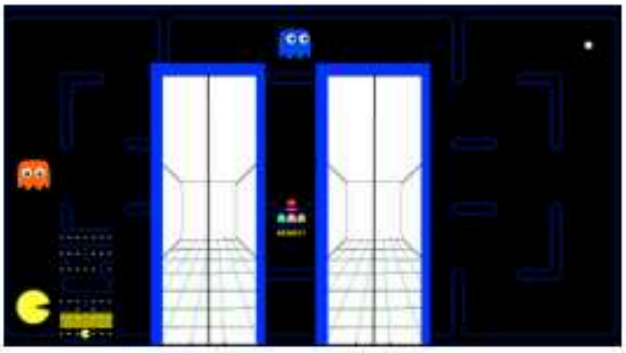

Based on the 3D model that Duarte and Enzo made, we created a template based on the blueprint.

Blueprint Designs

To confirm our template we created designs and put it as a texture on our 3D model.

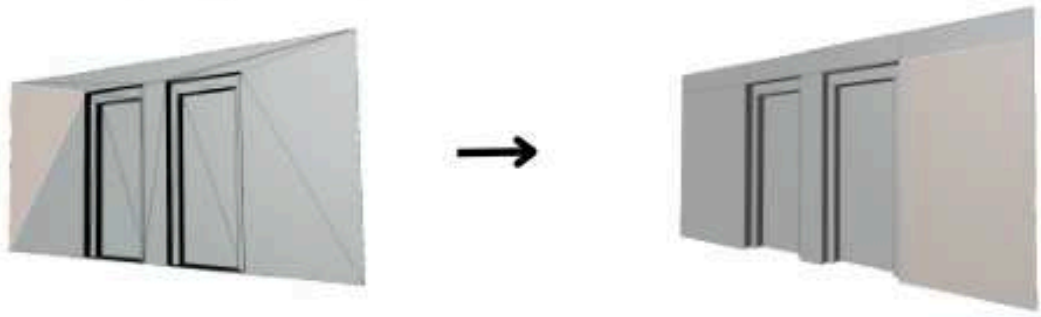

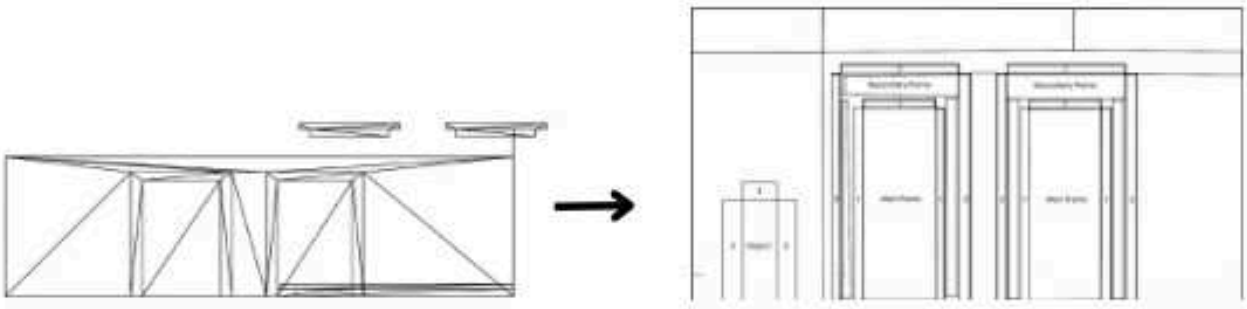

Unwrapping

After receiving the 3D model from Professor Nathan, we unwrapped it. This process involved transforming the small, **triangular** faces of the model into larger, more manageable shapes. This made it easier for us to lay out the model's surface in a way that we could map textures onto it accurately using a UV map.

UV mapping

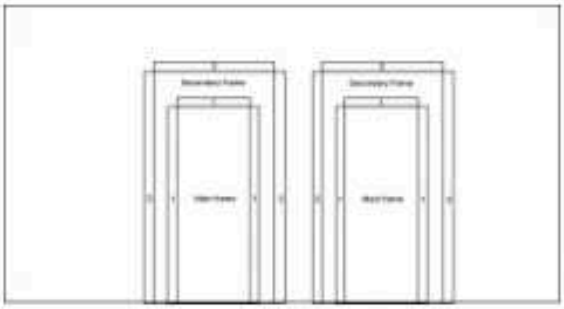

For the UV mapping, we began by designing a template in Figma. Once the template was ready, we manually placed each frame in its correct position, ensuring that each part of the model is **aligning** accurately with the corresponding section on the template. This process allowed us to create a precise UV map

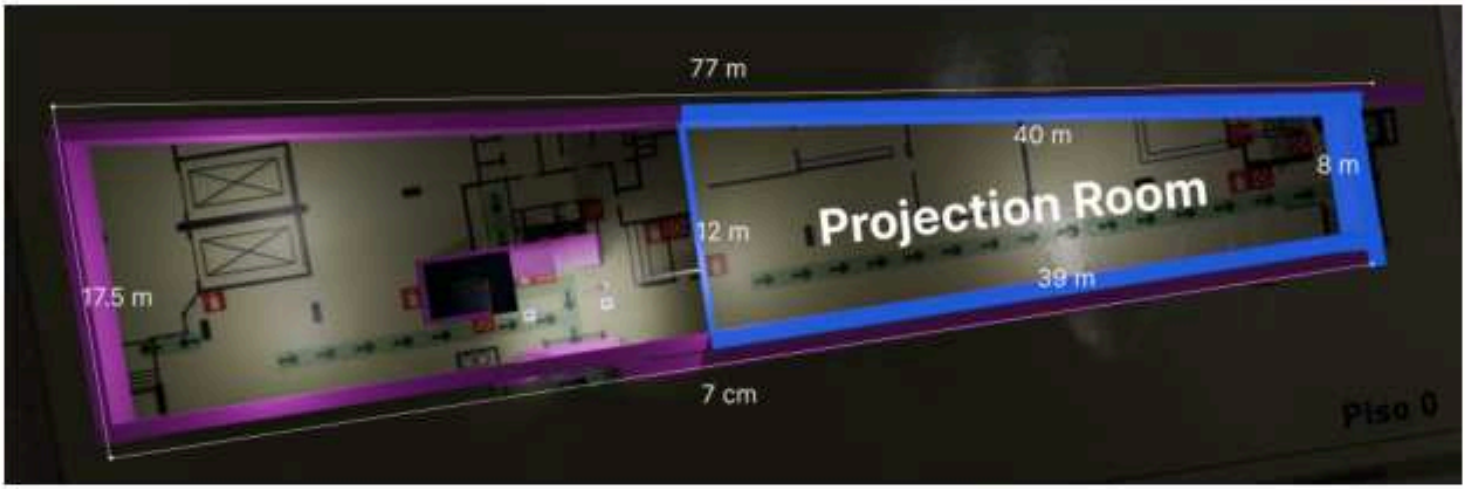

Template building

For the elevator model, we created an improved **2D UV** template. That include the inner faces of the elevator doors.

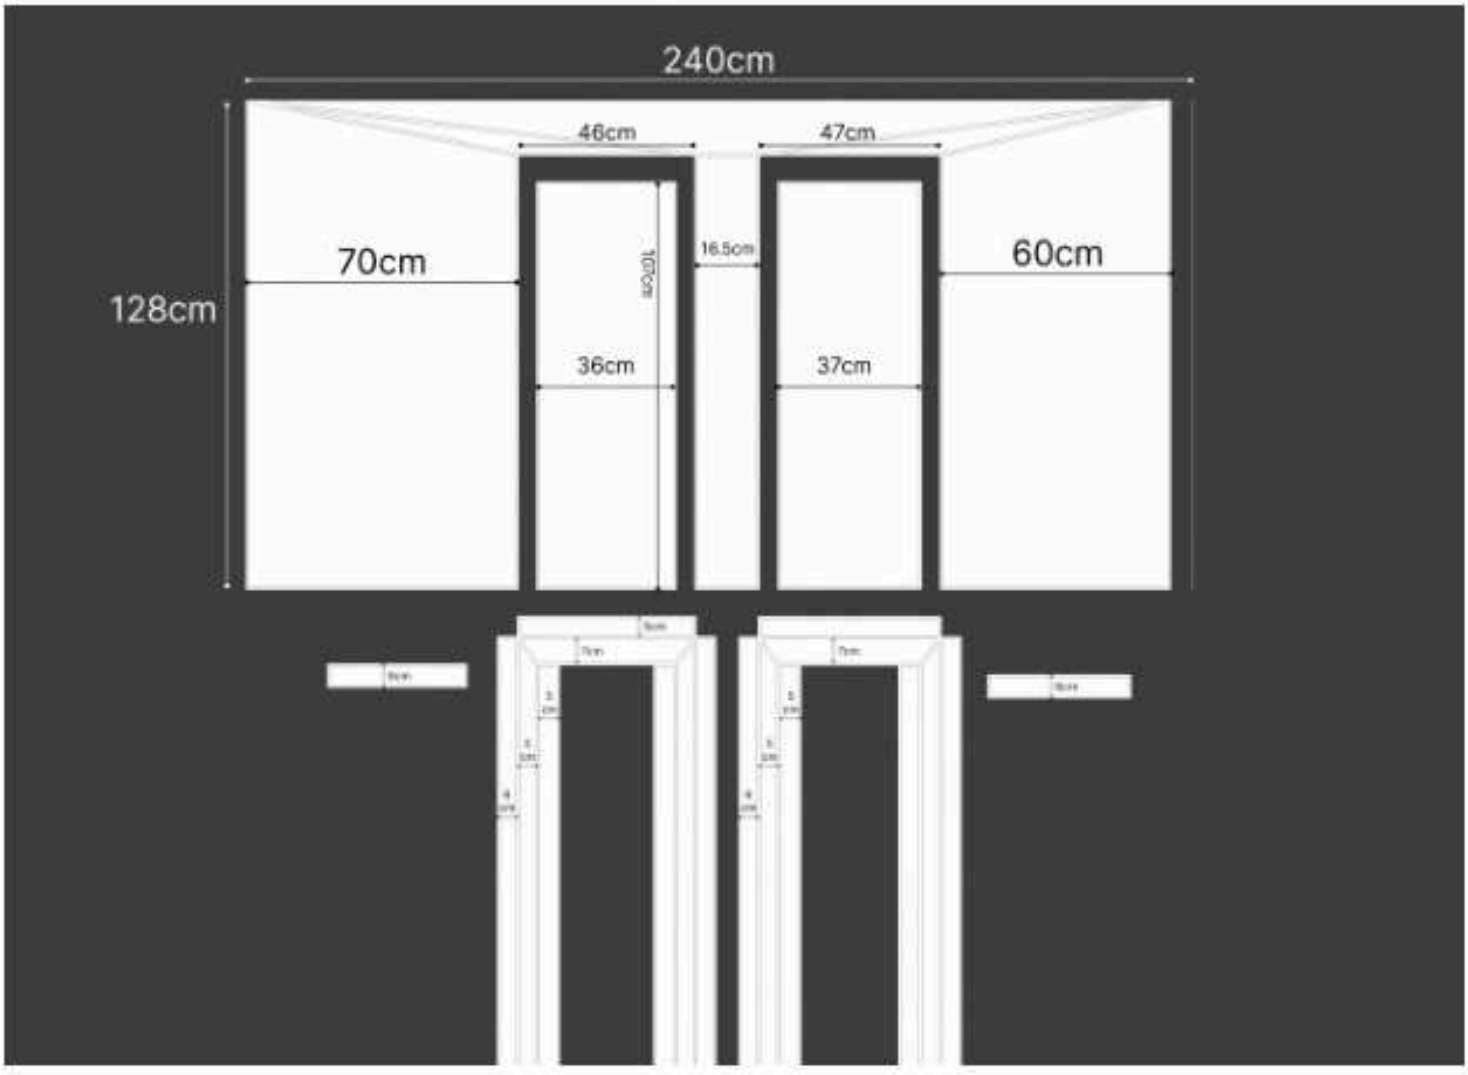

This allowed us to apply textures accurately, ensuring everything fits perfectly when mapped back onto the 3D model. Professor Nathan used it as inspiration for the final model that was sent to all of creative tech and global design.

5.3 The object

Factors to consider

When video mapping on elevator doors, several factors must be taken into account to ensure the best visual outcome. Of course the **depth and distortion of the surface** are being taken into account in our model. Besides that since the surface of the doors is dark, it's essential to **use bright colors in the projections**, as black tends to absorb light and can reduce the visibility of the projected content. We will be planning and testing a lot on our 3D model to ensure there are no surprises.

Our model

We will use a **cuboid as an object with a smooth surface**, for versatile utility. It will **represent the IADE building** and locate where the protagonist of our animation is. During other scenes we will use the object to project specific things on related to the animation.

Positioning

The cuboid will be placed on the **shorter side of the wall, in the corner** to make the most of the available space and keep the composition balanced. This way, the longer wall is left open for the main projections, allowing them to stand out without any distractions.

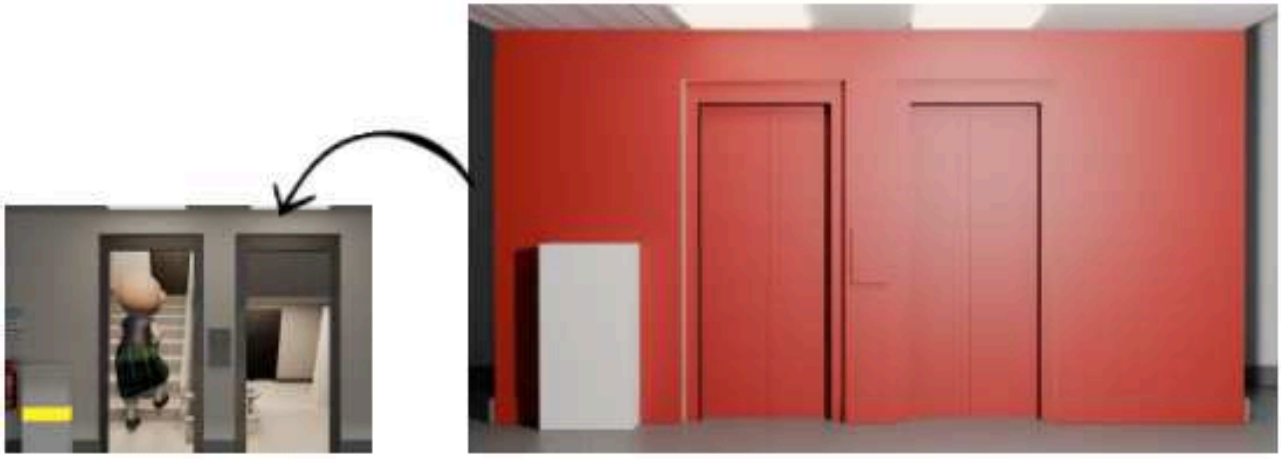

By positioning the cuboid this way, we avoid overcrowding the space and keep the focus on the projections, ensuring the overall look feels more cohesive and well proportioned.

Projection and application

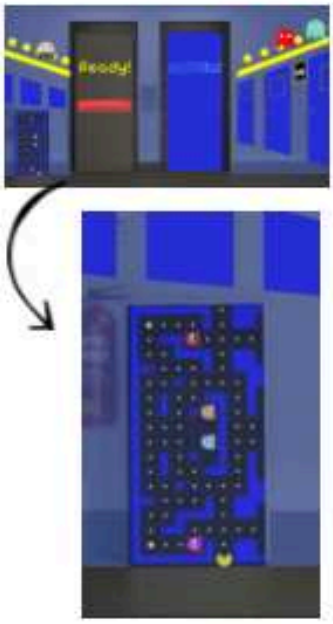

We clearly decided on how we will divide the projection surface for each floor. Considering among others the elevator doors, the big wall and the object.

The model will serve different purposes on each floor, with the IADE building being shown during the cutscenes as the character walks up the stairs. As the character ascends, the floor located will light up, highlighting each step of the journey.

1st floor

On the first floor (Pacman scene), the object will act as a mini-map, reflecting the character's feeling of being stuck in the game. It helps guide the character as they navigate through the maze. The doors will be deep hallways representing the IADE's corridors on the first floor.

Projection and application

2nd floor

On the second floor (the tuna scene), the object transforms into a drum, with a tuna member sitting on top, playing the drum in this interactive, musical moment. For the doors of the elevator one will show Twister dancing and the other door will be a Tuna flag waving.

3rd floor

On the third floor, the object becomes a 3D printer, where Twister will turn into a 3D version of himself, marking a significant transformation in the storyline. Here, one of the elevator doors will turn into a class door and the other one a window where our character will look through.

Projection and application

4th floor

On the fourth floor, the character will enter a green screen room and teleport into a tropical rainforest. The object will serve as a mini-map of the rainforest, guiding the character through the lush environment as they explore. The doors will be the mud roads in the jungle.

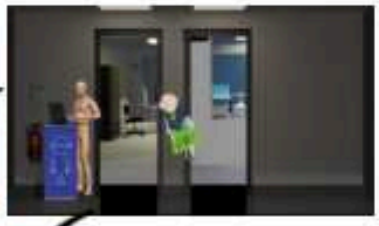

5th floor

On the fifth floor, the object turns into a blueprint of Twister's 2D body, providing a detailed look at his original design and structure. For the doors of the elevator: one will show the hallway. The character walks to the end of the hallway and arrives at the IT support department. The other door is the entrance to the IT support department, with IT staff standing behind it.

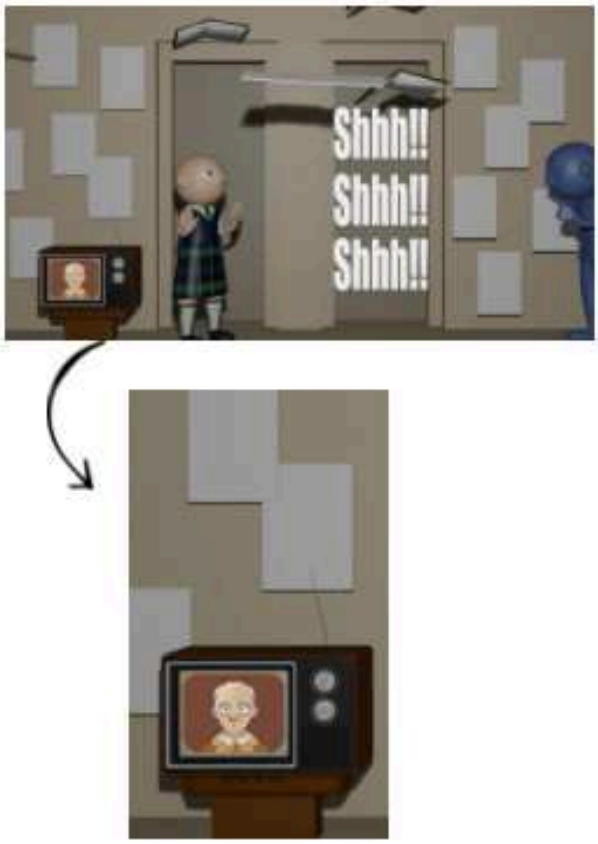

Projection and application

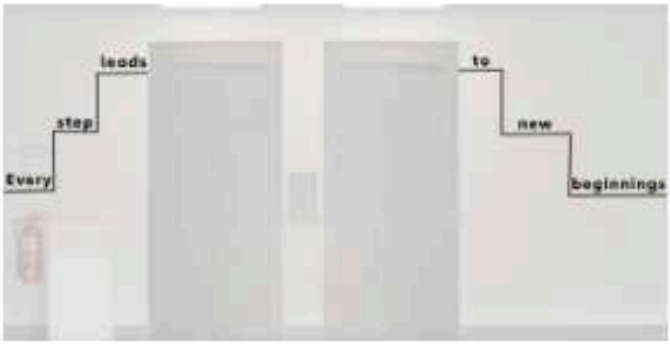

6th floor

On the sixth floor, the object becomes a retro TV, taking Twister back in time to meet Antônio Quadros in the library, creating a nostalgic and historical atmosphere. On on door will be Twister and on the other door Antonio Quadrios. They will have a dialogue.

7th floor

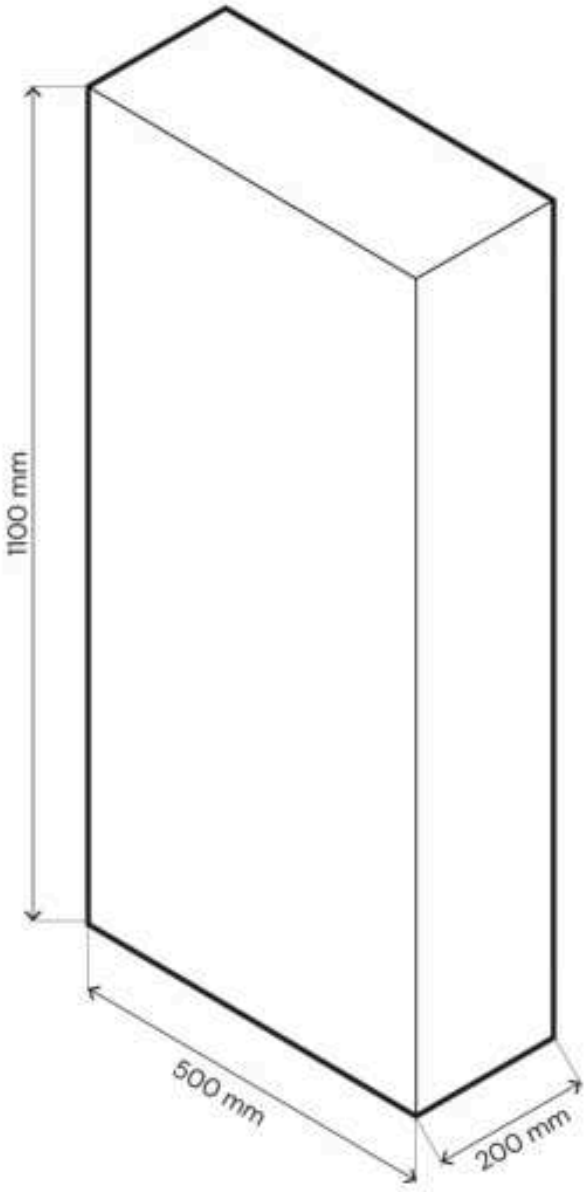

Finally, **on the seventh floor,** the model initially shows the old IADE building, but when the character opens a door, the scene transitions into the new campus building, symbolizing change and progress. For the doors of the elevator: one door focuses on his feet slowly being dragged up the final stair steps. The other door is the door the character is about to open and show the new campus.

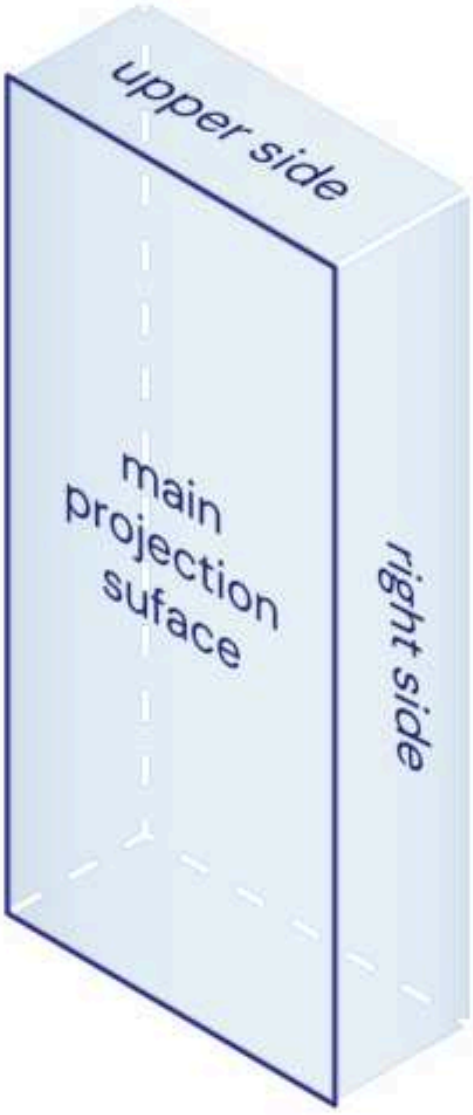

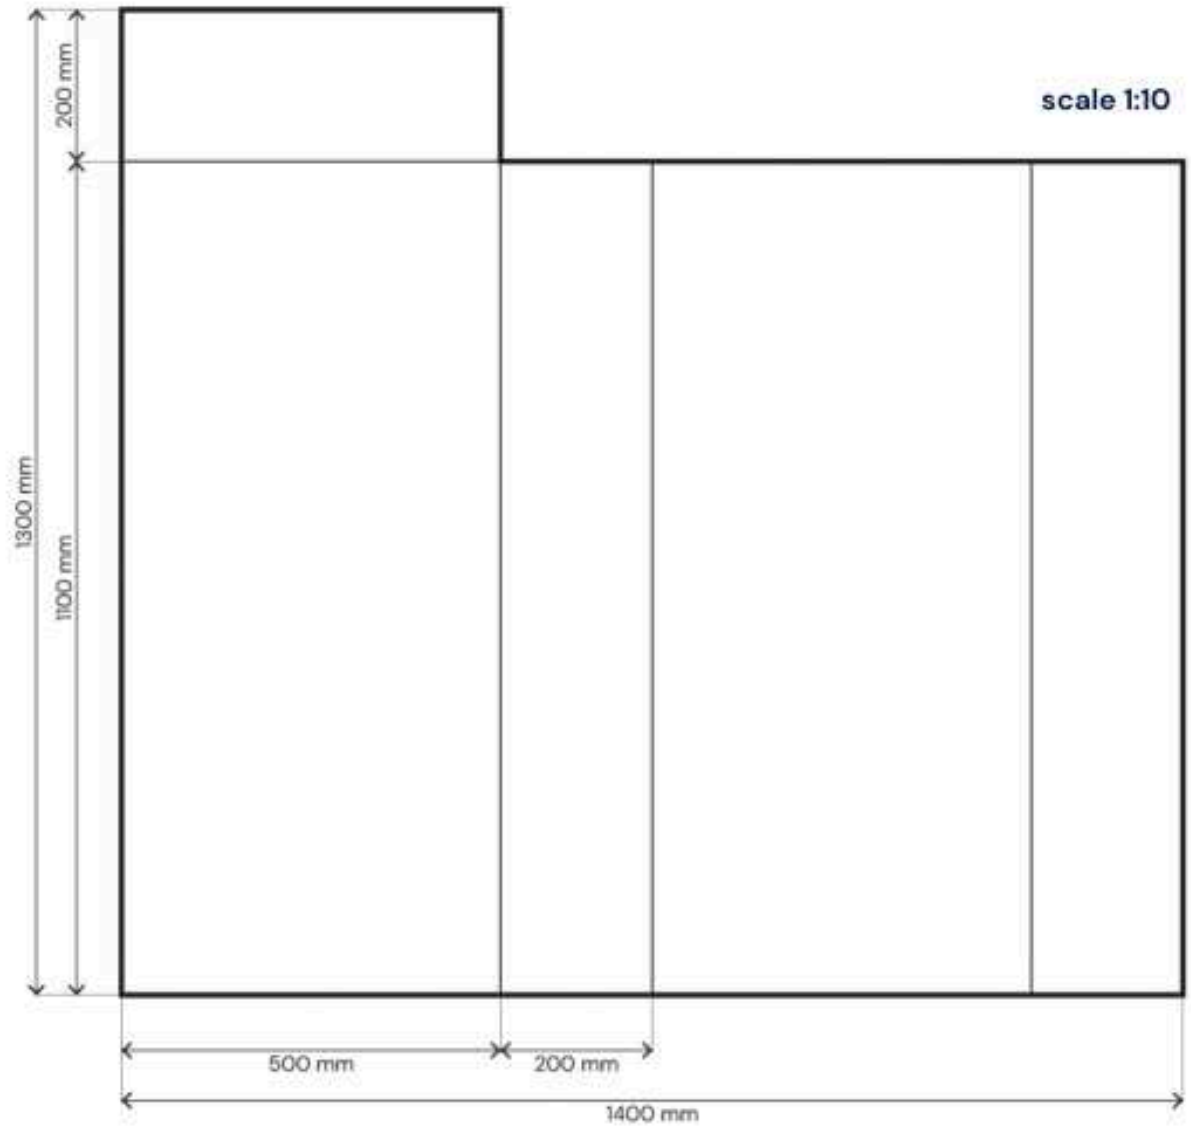

The Object - Manufacturing

The object was created using a 3 mm thick sheet of Poliplat (Carton Plume) as the material. The object consists of a hollow parallelepiped (without a base). The original dimensions established were 1100*500*200 mm, however, the model of the projection surface is at a scale of 1:2, consequently the actual dimensions of the object were adjusted to that scale, thus resulting in 550*250*100 mm.

scale 1:10

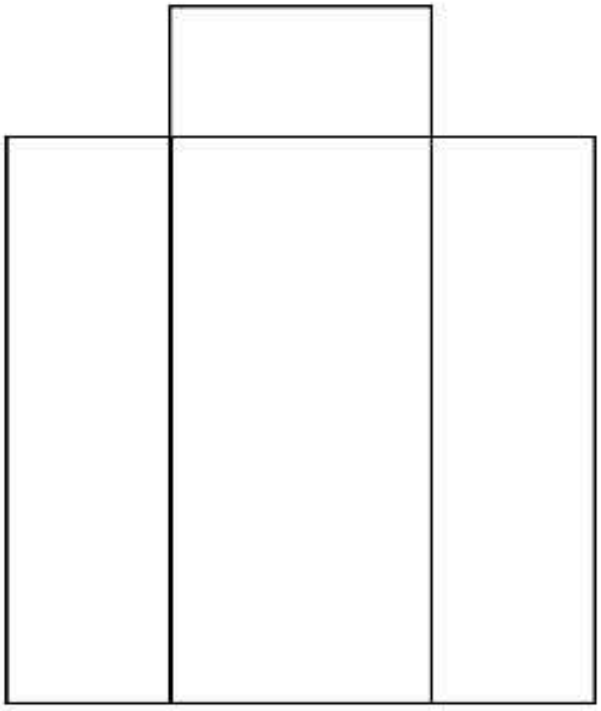

scale 1:10
200 mm
1300 mm
1100 mm
500 mm
200 mm
1400 mm

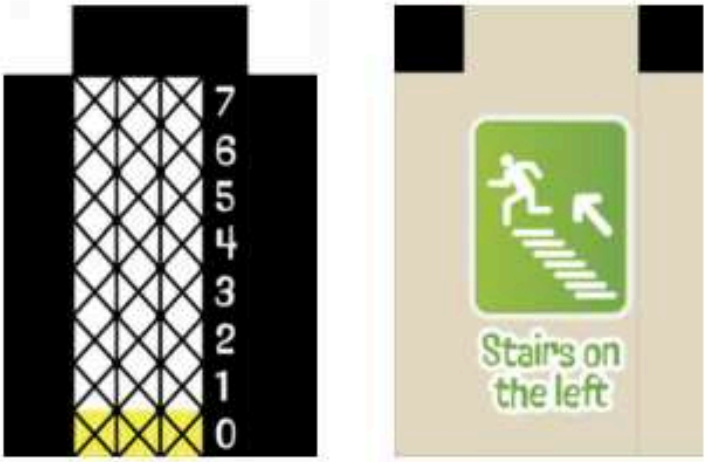

The Object – Projection

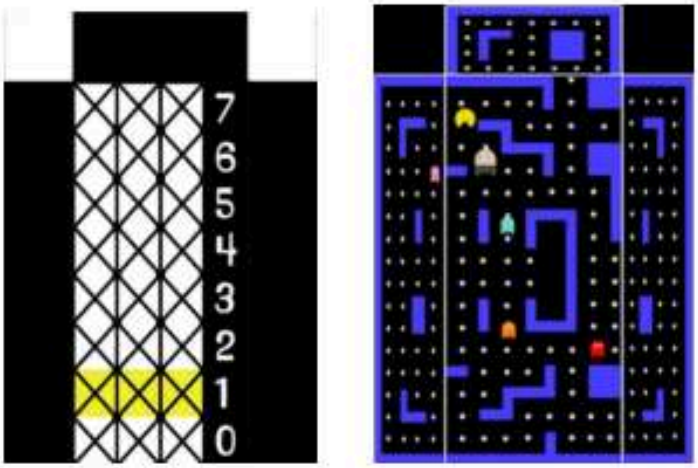

For the projection of the object, it was necessary to create a UV template with the various faces defined. Each plane of the animation presents a different use of the object, shown below.

5.4 Color testing

Image research and selection

To begin testing colors, we selected a wide range of different images that might be interesting for the study. We divided the images into three different **macrocategories**: color, contrast, and overall impression. We organized everything in Figma, so we could quickly scroll through the various categories.

In the category regarding **color**, we then divided the images into different sections, grouping them by predominant color, in order to be able to understand the difference between the various hues and pairings.

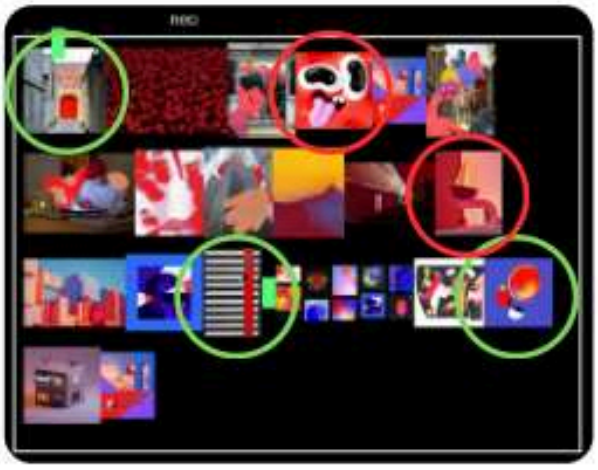

The category concerning **contrast** included all those images with a high or low level of apparent contrast, to be able to understand what might be incorrect or recommended pairings and what was the appropriate level of contrast between the various colors in the image.

The last category is about **overall impression**, it concerns very colorful images with different color pairings, to be able to glean an overall impression, of what might or might not work.

Macrocategory 1 - Color

We then tested a selection of eight different colors: red, orange, yellow, green, blue, pink, gray, and a selection of different skin colors. Each test gave different results, but these varied from one projector to another. We then calibrated the color test on the projector that had the least capacity to process colors, as almost no problems were evident on the newer projector.

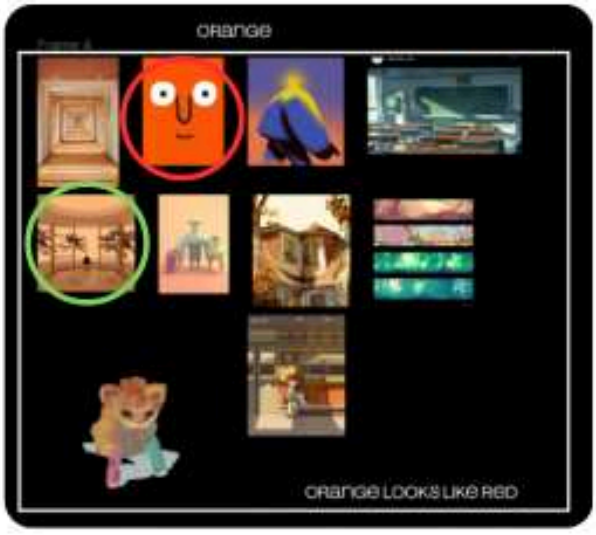

Red

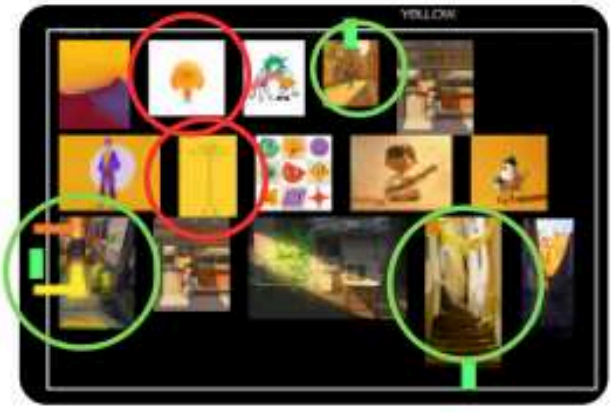

When we tried to test the red-dominant images on the side, we learned that some of these shades work very well (circled in green) while, others have poor visibility of red variations in the image (circled in red).

We observed that it is difficult to be able to distinguish various shades of red with little contrast between them placed side by side.

Orange

Regarding orange and the different shades, the low-range projector could not project the color faithfully, projecting shades of red or brown instead of the original color. As for the newer projector, on the other hand, orange gave no problem, being clearly distinguishable from other shades.

Yellow

Tests conducted on the color yellow revealed that the low-end projector had difficulty projecting a vivid yellow, projecting several shades of orange in most cases. However, it was found that by juxtaposing various shades of yellow and different background colors, it is possible to recreate the illusion of a pure yellow due to the context in which it is placed and its brightness.

Green and blue

On the other hand, a similar situation arises with regard to the colors green and blue, characterized by the fact that most of the shades of these two colors were extremely similar to each other, unless the brightness level of the two shades was really different. We then selected the hues that were most appealing when projected, discarding all images in which it was not possible to differentiate the various hues or in which they were altered excessively.

In the case of the color color green this situation presented itself in a mitigated way, on the other hand it was much more evident with the test on the color blue.
Considering the poor differentiation between the various hues, also in the case of green and blue, as in the previous ones, the projected images were characterized by low contrast and slight color alteration

Pink

When we tested the different colors, pink was definitely the one that along with orange gave many of the most problems. When projected with the low-range projector, pink could not hold up to the brightness and hue, becoming a dark purple in most cases. We therefore decided to limit the use of the color pink as much as possible within our projection, as it was not extremely necessary.

Grey

As for gray, a mixed situation similar to those of all the colors previously analyzed is presented. The projected gray took on a uniform grayish hue, in which it was not possible to distinguish the warm/cold, cool undertone or its brightness without a term of comparison with a brighter color or a pure white. These reflections will be taken up within the macro category regarding tests for contrast.

Skin tone

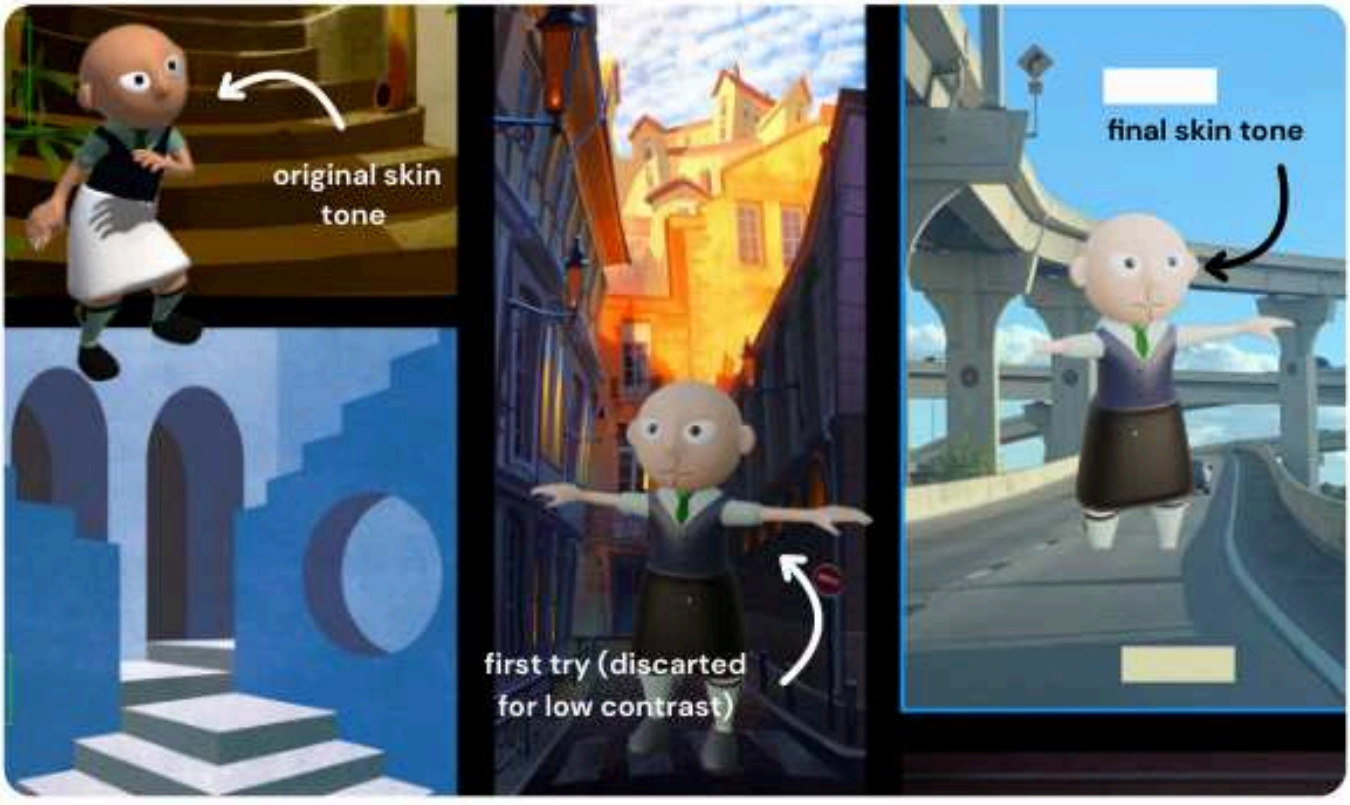

Regarding skin color, we tried projecting some tests of the 3D model of Twister, and the first test done resulted in a much darker and more intense color than we had expected. We then tried to change the shade of the photo through the settings in Figma until we arrived at a skin tone that we could be satisfied with, which when projected is much closer to what we had originally thought.

We tried to test different colorations through skin color palettes using them as references so that we could test different combinations, understand how lights and shadows were projected.

We then tried to overlay the different skin tones within some images that had certain characteristics such as a dark light setting, or a very colorful setting, to be able to see whether the skin tone was adaptable to each situation presented.

Macrocategory 2 - Overall Impression

Regarding the overall impression, we selected three main images characterized by a wide combination of many different colors with each other, with different levels of **saturation, contrast, and brightness**. We chose these three images for their **eye-catching**, colorful, and bright impression, with an on-screen impression very similar to the desired color palette concept within our videomapping episode.

All three images resulted in a poor image when projected with the low-range projector; the images were extremely **dark** and the colors were not appealing at all, resulting in a visually very **heavy and confusing image**.

On the other hand, when projected onto the surface through the new projector, the images were very faithful to those displayed on the computer screen, characterized by high contrast, attractive colors, and a very positive overall impression.

Therefore, in order to avoid errors at the time of projection, we decided to take into account the result obtained from the projection with the low-end projector, since, in this way, we have the opportunity to have a **margin for improvement but not for error**.

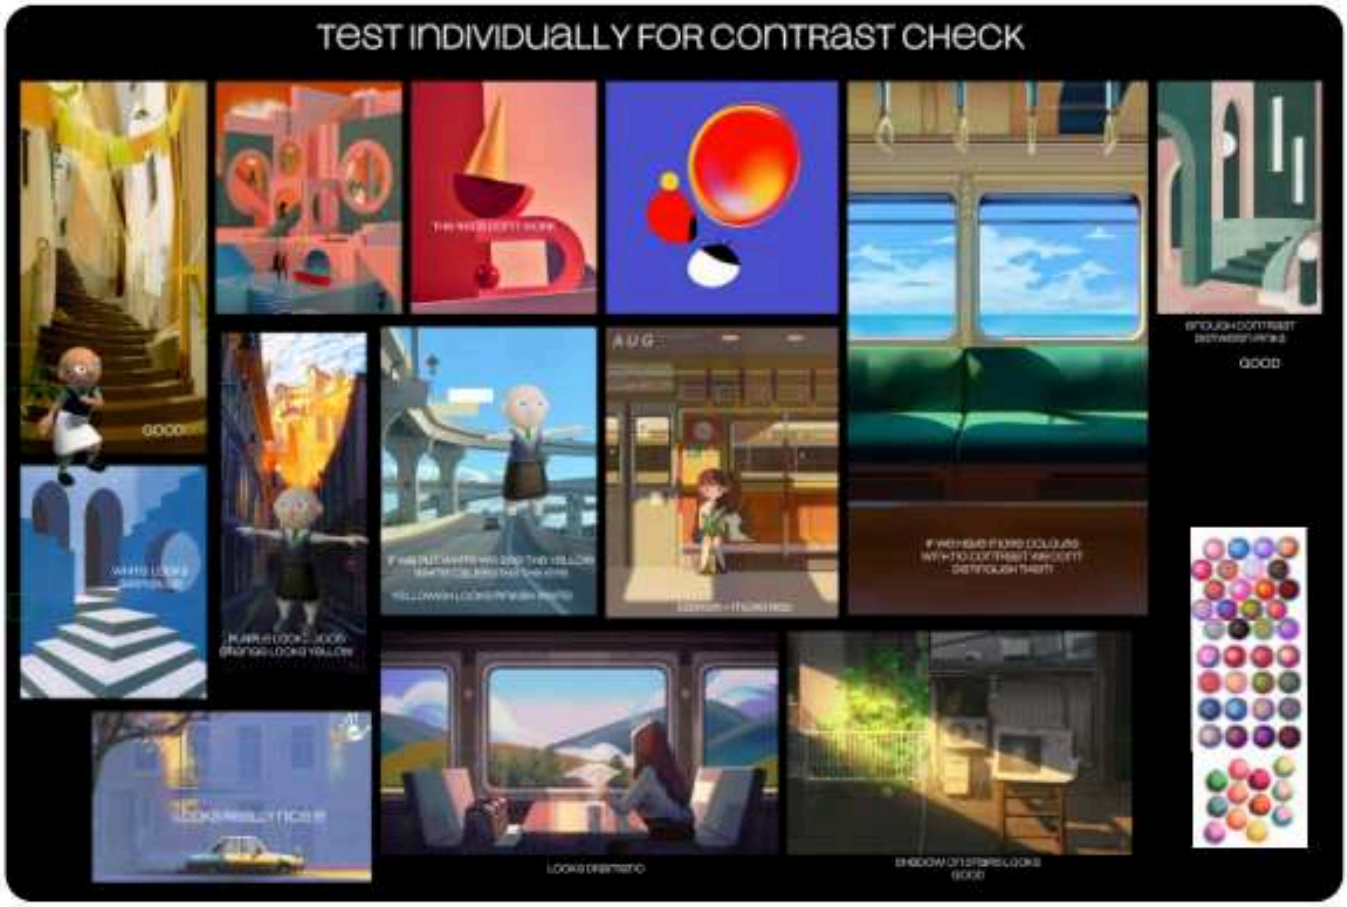

Macrocategory 3 - Contrast

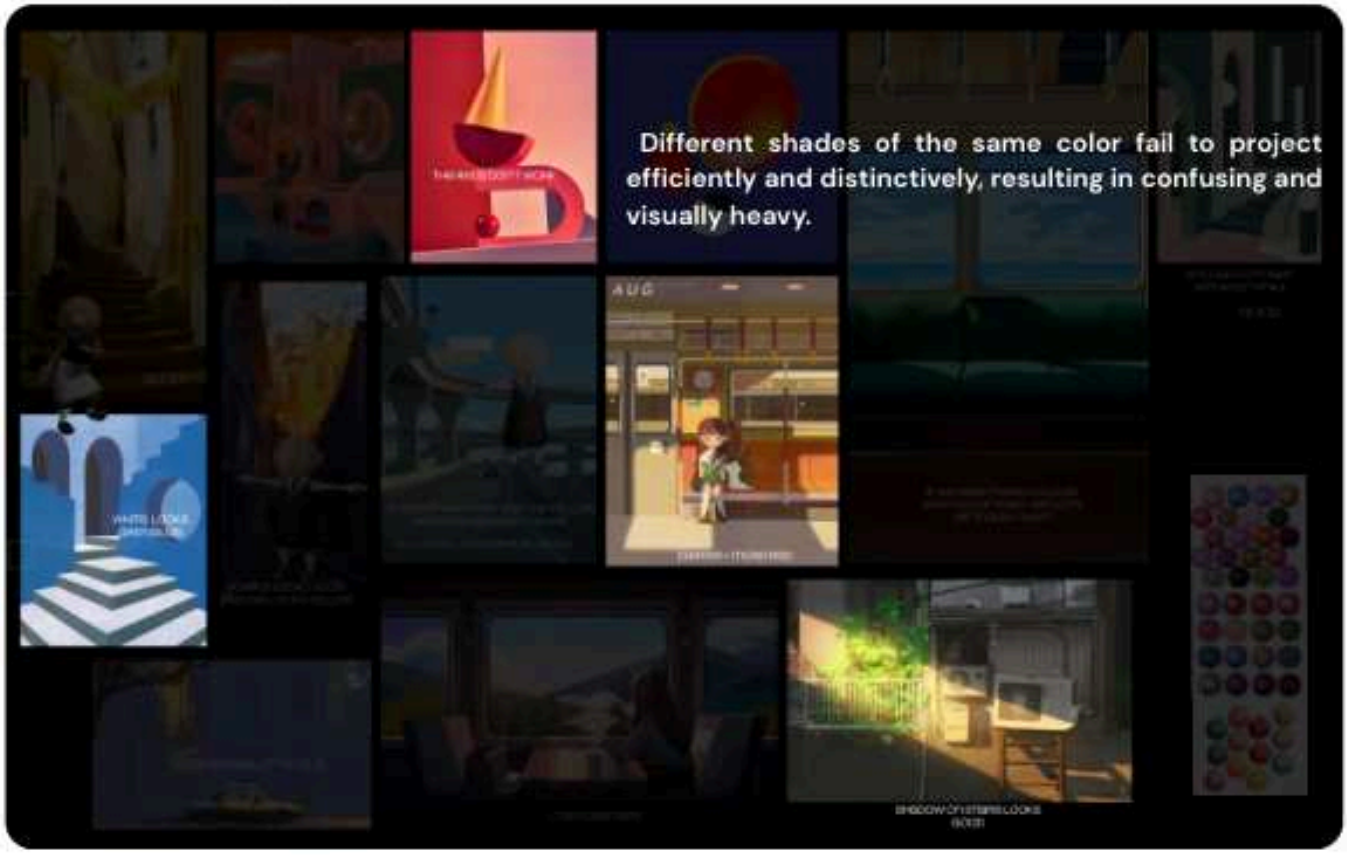

The last macro category is about **contrast**.

We selected, therefore, a variety of images that were interesting in terms of brightness, contrast, and the pairing between colors with the same hue and different colors, in order to be able to understand how they behaved in relation to each other more thoroughly than the general testing done on individual colors.

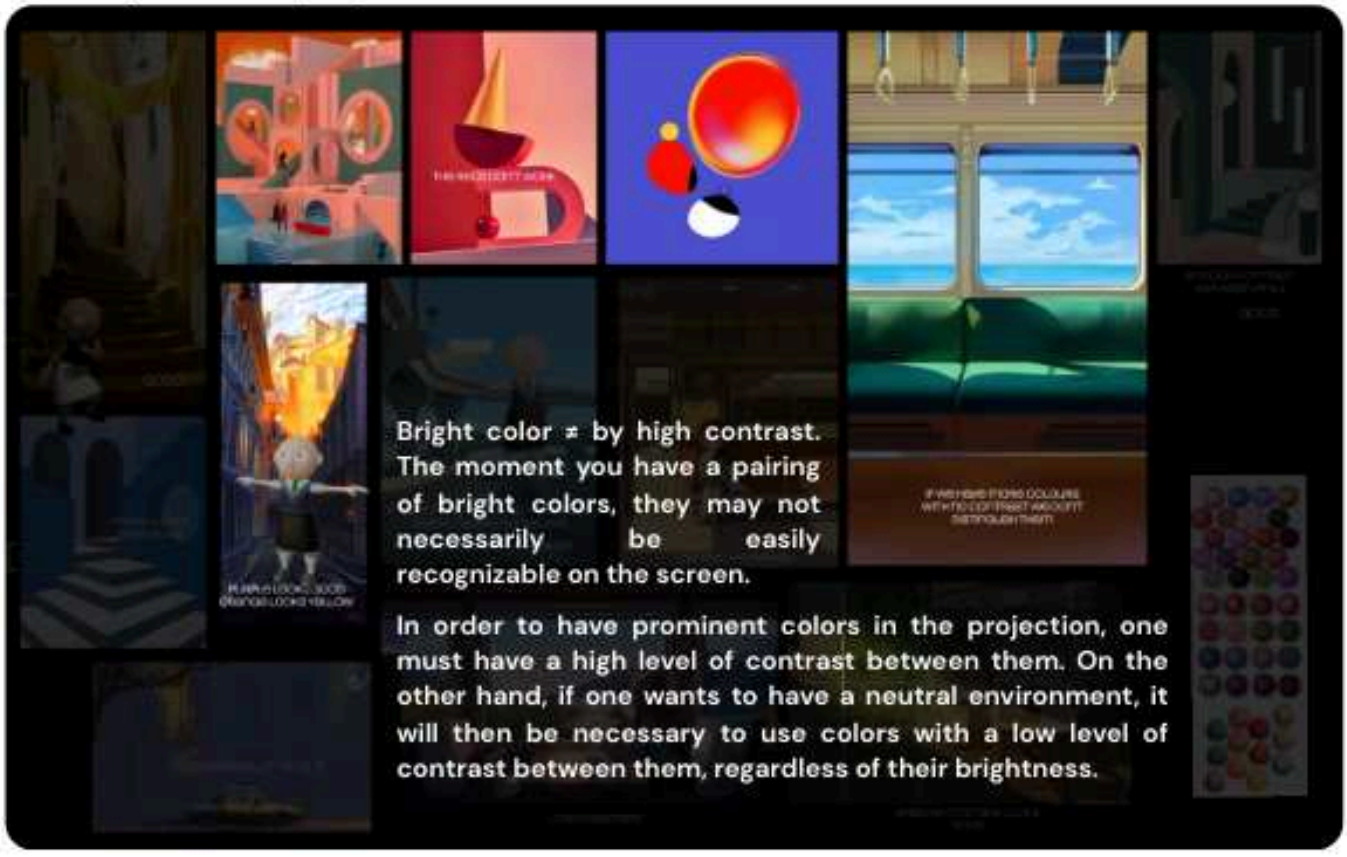

This was the most **productive** and **successful** test, as we were able to understand several issues or efficient outputs.

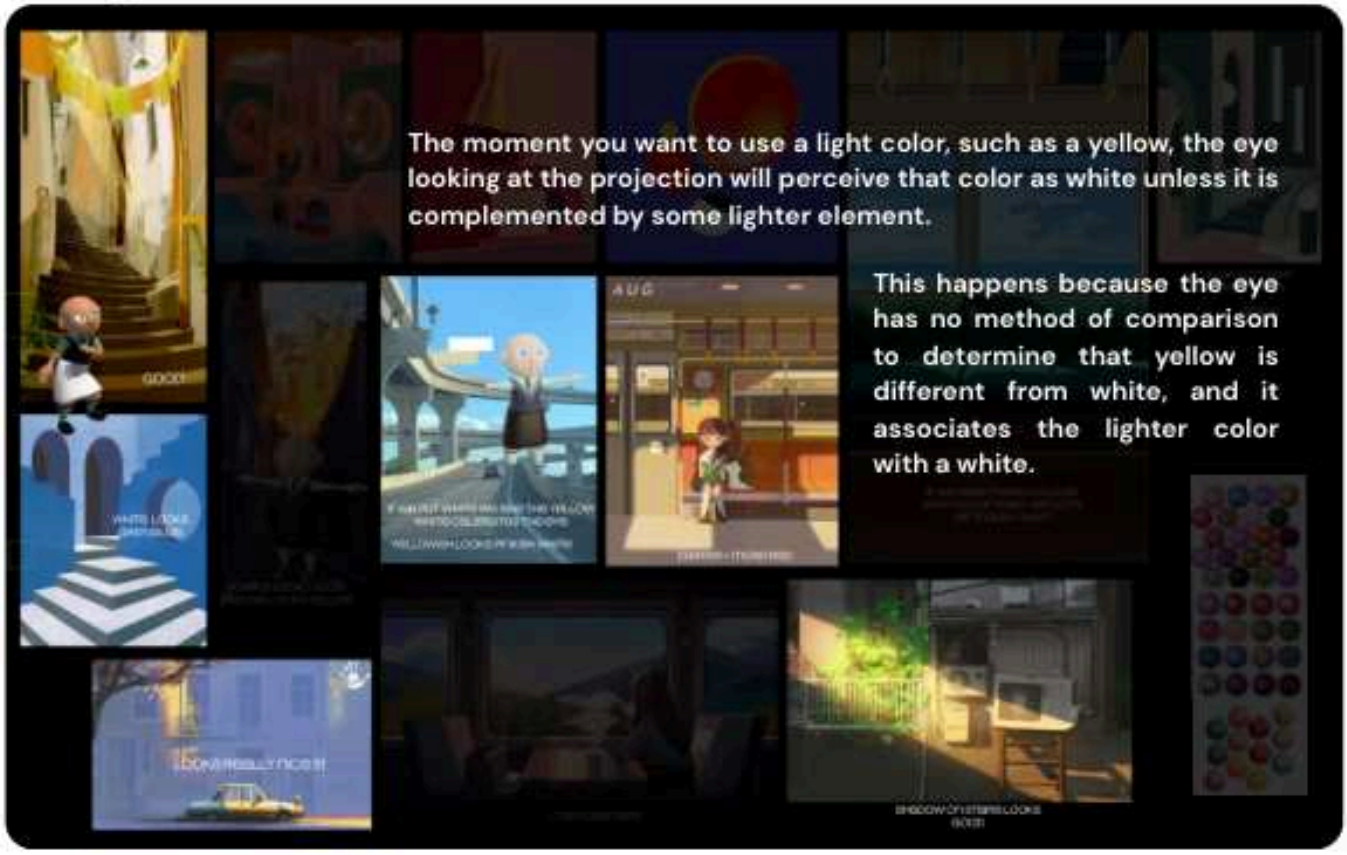

1. Same colours, different shades

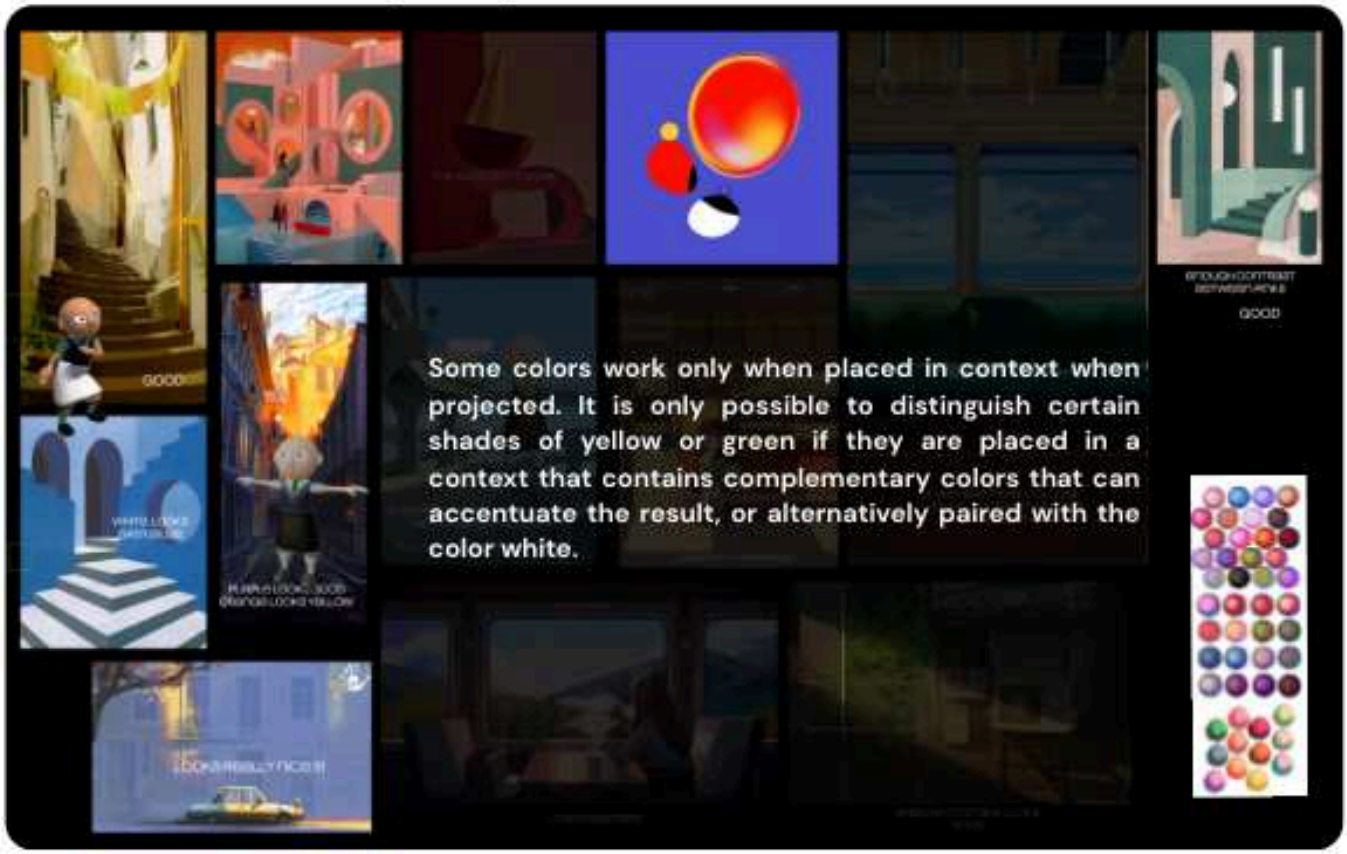

2. Bright color ≠ by high contrast

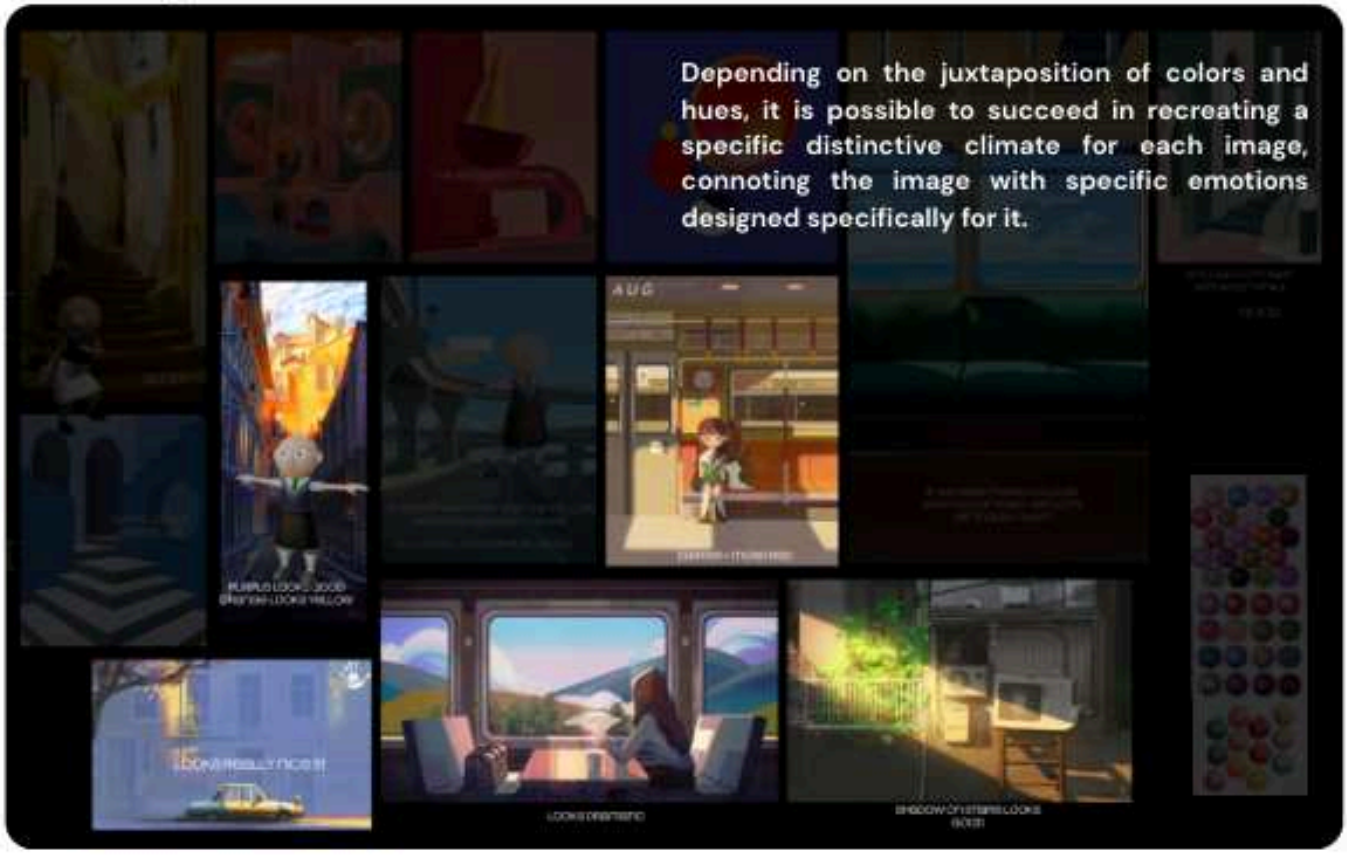

3. Light colors look like white

4. Some colors work only when placed in context

5. Pairing colors creates emotion

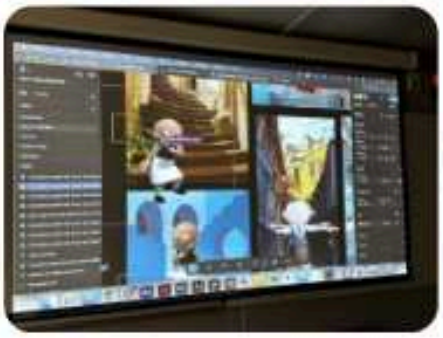

Projection color testing

06 Promotional Campaign

Promotional Campaign

09

6.1 Campaign

Creative Direction

In order to promote our videomapping show, we created a specific campaign that could connect all of our creative direction and medias in a cohesive way, ensuring that we surprise, convince and intrigue our audience to participate and join the show.
We want our promotional campaign to:

- Balance the humor and chaotic environment of our animation
- Have a layered sense of mystery and curiosity
- Keep playful and story-driven approach from animation and our studio
- Tease the narrative and visual style of the show just enough to build intrigue and curiosity

To accomplish this, we first decided some essential descriptors of how the campaign should be, including who we would be targeting, as well as the tone and content to be shown.

TARGET AUDIENCE

- IADE students
- Other members of IADE community (alumni, staff, etc)
- Others from creative community

TONE & CONTENT

- Quirky but professional
- Playful but strategic
- Relatable content
- Connect Twister with audience
  - approachable & recognizable
- Include easily identifiable details for IADE
- Mimic character floor progression

These ideas originated from other successful movie campaigns that were able to integrate intricate details of the movie into the campaign, leading to greater intrigue, also using social media features to boost sales, and partering with popular figures that have a fan base of within the desired target audiences. We emulated some of their strategies and adapted them to the context of our show.

6.2 Promotional Media

Interactive & Printed Poster

One of our first promotional directions for What The Floor?'s campaign was our printed & interactive poster. The interactive poster was developed and brought to life using Unity. The concept involves a simple three-color background with subtle visual details and our logo, focusing attention on our character Twister. Our first plan for the interactivity was Twister standing awkwardly, smiling, until the "command" is activated and he notices the logo next to him moving. As he tries to grab it to stop its motion, he clumsily trips and tumbles down the flight of stairs. This humorous and unexpected moment aims to create a playful user interaction, blending storytelling with motion to reflect our design spirit. A sketch of the poster is below to illustrate the idea. However, after a few tests, we quickly realized that a more subtle and simplistic approach would be better, not only in terms of time management to produce this, but also having something that very subtly conveyed Twister's clumsy personality. So, we changed it to him running through the three floors, being triggered by specific GameObjects in the scene, and while on the middle floor, he would have quick but humorous stumble moment. This would then keep looping throughout. We believe this worked better within the time scope we had and functioned well for our developement of the printed poster, that shares many direct resemblences to the interactive one.

1st sketch

Final poster

To check out the interactive Unity-made poster, access the following link:
https://giuliana-cg.itch.io/what-the-floor-poster

Social Media

For the social media strategy, we kept the general creative campaign direction but made sure to adapt it to a somewhat more informal approach that fits better in this media context. Our intention is that our pages and posts reach as many people as possible, generating intrigue, but also containing interesting details that an IADE student might be the only one to understand. This way we are able to create a general promotion, while we connect to a specific and important target audience.

Posts:

- Short-form, looping content
- Animated eyes in "What the Floor?
- "A day in the life" of IKAF* Studio with snippets of animation tests, bloopers, and modeling.
- Carousel posts showing sneak-peaks of environments, details on characters and curiosities.

Partnerships:

Social media connections and interactions with:

- IADE pages (including TAI, AE, Fabrica)
- Collaborations with university influencers

posts - color scheme

The stories

Stories:

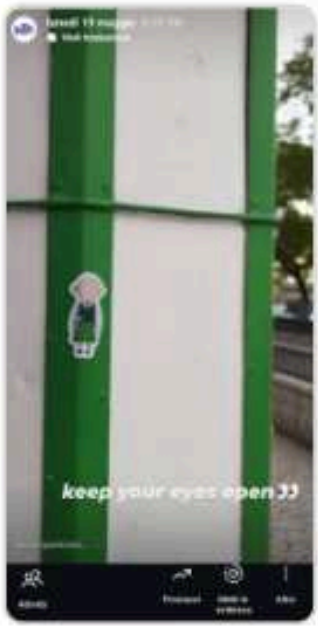

- More informal, real-time look
- Behind-the-scenes snippets of the Twister "acting" or participating in creation → approachability
- Polls and quizzes for relability & student experience.
- Themed stickers of Twister.

Physical Campaign

As part of the our promotional campaign, we believed it was interesting to include a series of playful and thematic physical installations throughout IADE to build intrigue and connect directly with the student and staff community. Being the location where both the story takes place and the audience resides, IADE is the ideal location for this kind of site-specific promotion, blurring the lines between reality and the animation. We believe that placing them in areas of bigger traffic or even in place of significance to the animations' narrative can be a trigger for making the audience go and help them connect during the show. We reckon that this can spark curiosity and make the promotion feel like a natural extension of the animation.

Examples of possible approaches:

- Staircase Adhesive: Logo spread through stair steps.
- Bathroom mirror visuals with slogan and story references to the animation.
- Elevator Poster: A bold "broken elevator" decal on the outside with text like "Don't count on it" with What The Floor release date.

6.3 Merchandise

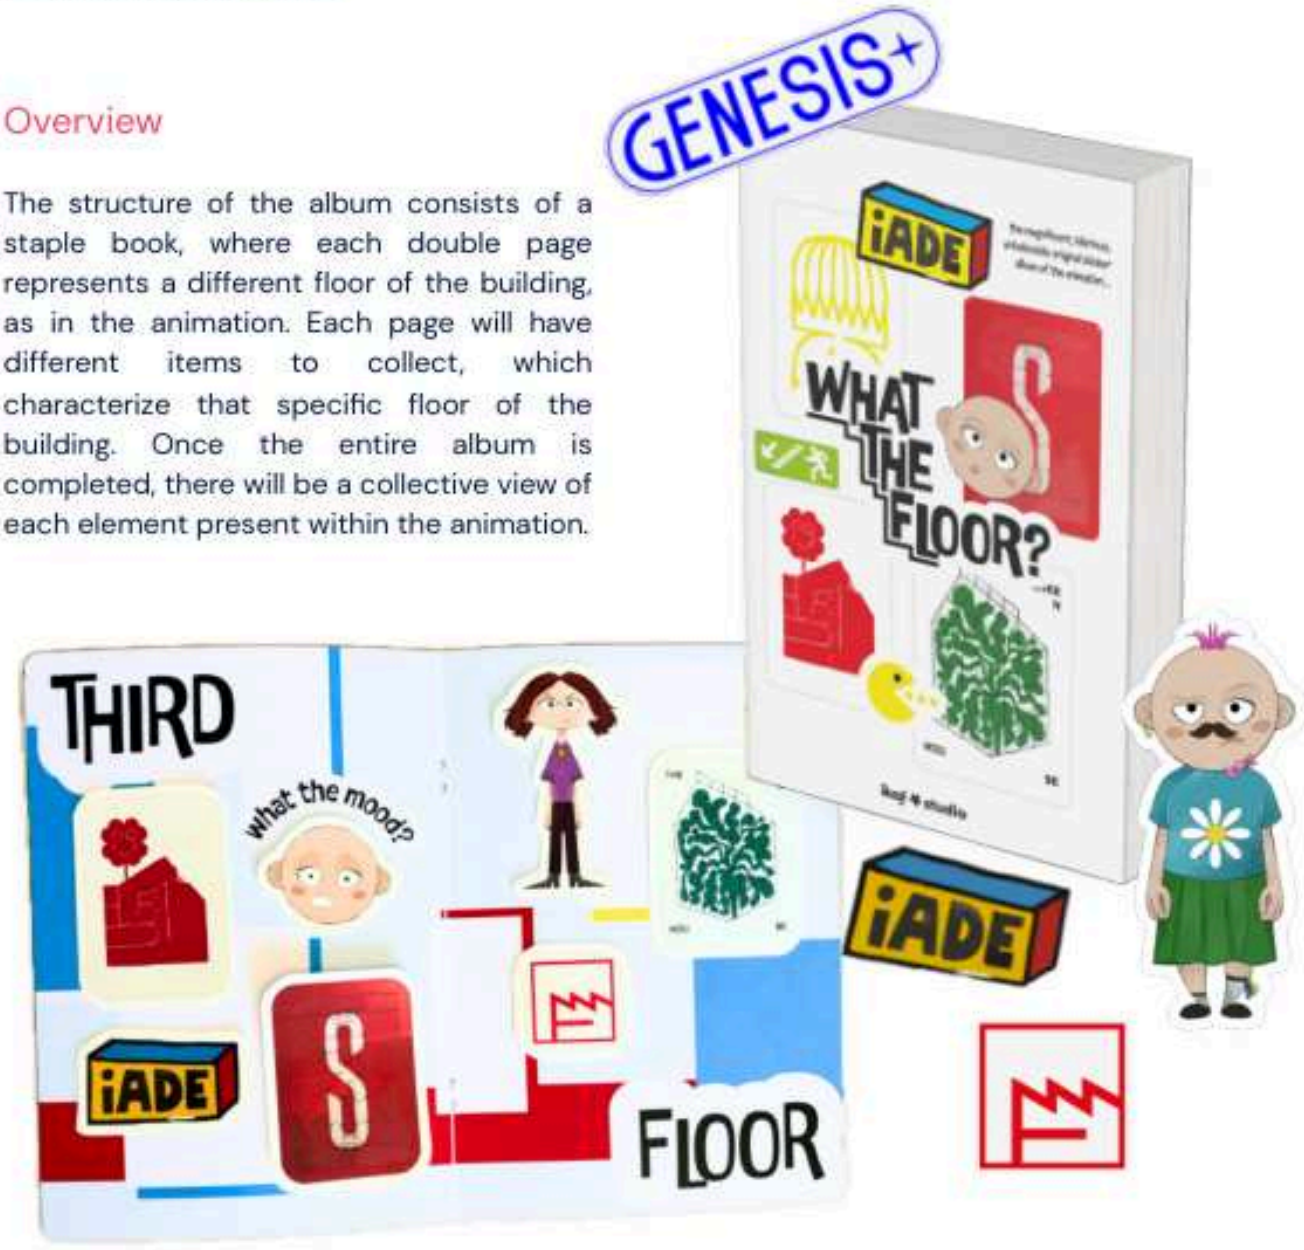

Themed Sticker Album

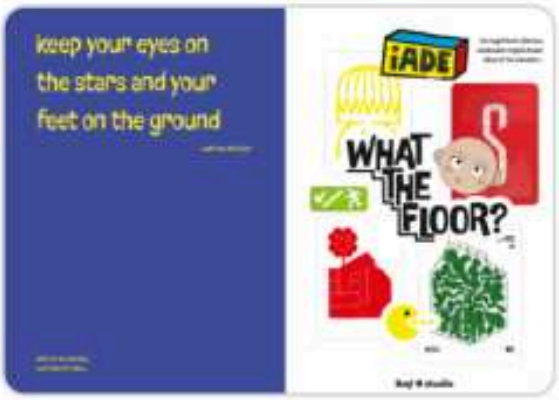

The idea

The collectible sticker album is a unique and irreverent merchandise idea that reminds the person who uses it of the unique and inimitable memories of when they were a child. The idea of the album comes from an irreverent desire to awaken the inner child in each at person, with a note of playfulness but at the same time commitment and perseverance. Through this album we want to communicate the experience of IADE, an irreverent experience, in which each of us can return the learning child.

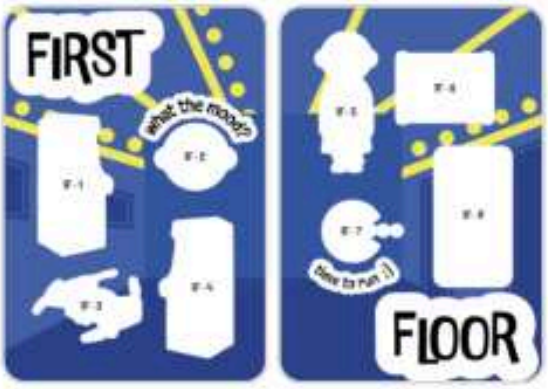

Overview

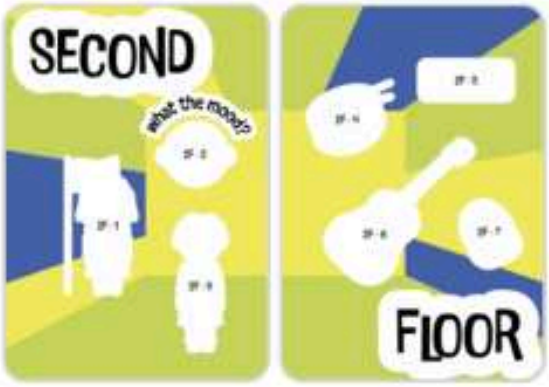

The structure of the album consists of a staple book, where each double page represents a different floor of the building, as in the animation. Each page will have different items to collect, which characterize that specific floor of the building. Once the entire album is completed, there will be a collective view of each element present within the animation.

The envelopes

total project

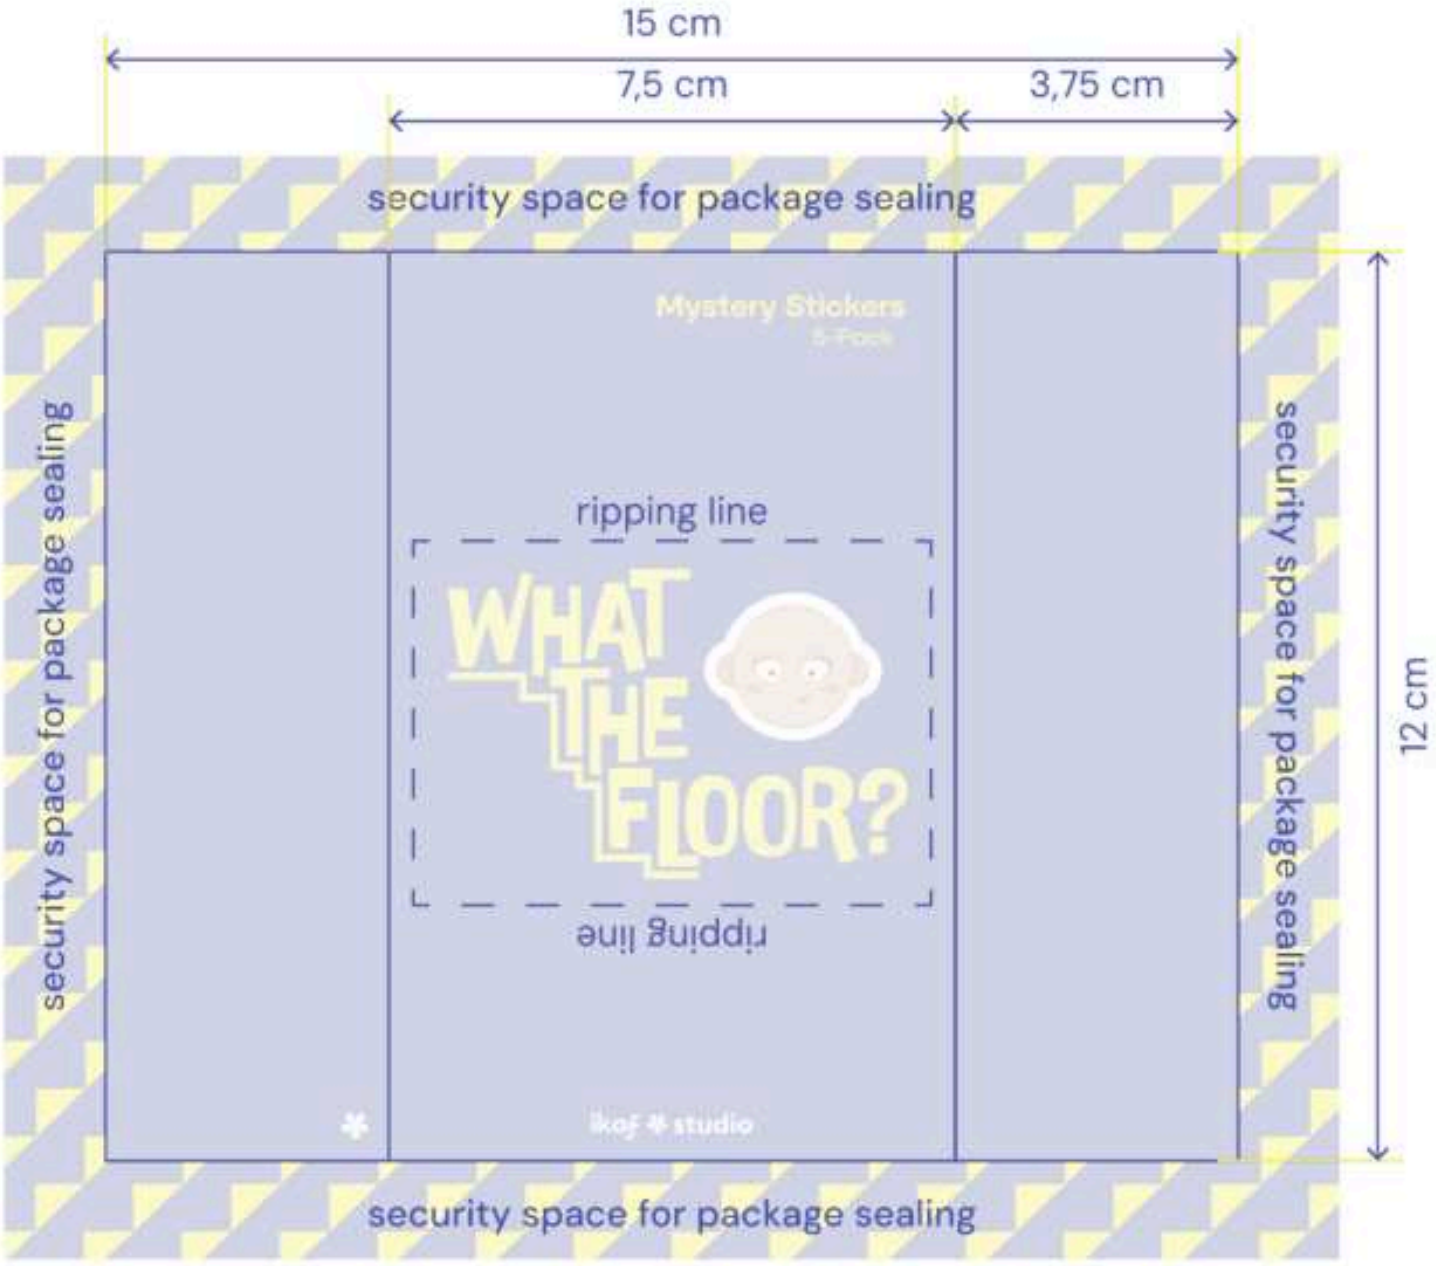

back

front

scale 1 : 1

The pack is designed to fit five stickers per envelope. It is designed to minimize the space required on the page and thus maximize organization by allowing two packets to be printed per A4 sheet.

The package is designed with an extra sticker on the front, to minimize waste when opening the packet. It therefore has a light perforated cut in such a way that the consumer can tear off only the relevant part and then obtain the extra sticker.

Mini Mystery Packs

"What The Floor - Mystery Packs" is an **unconventional merchandising** idea, in which the user is included in the first person in the research of elements hidden in the environment, which refer to the animation.

This idea includes: envelopes **hidden around IADE**'s floors with stickers, QRs with exclusive animation or interaction, character cards, pins, unseen physical elements of the animation inside.

WTF - DIY your merch

The idea behind this type of merchandise comes from an idea of **collaboration** with the various **laboratories** in IADE. in this way it will be possible to customize the merchandise to the user's preference, choosing from a combination of various possible options, mixing them together.

This will allow the user to interface with the **creative reality of IADE**, and thus be able to have a **personalized merchandise experience**.

Collaboration with - 3D Lab

Through the collaboration between WTF and 3D Lab, you will be able to choose to 3D print and finish your favorite collectibles, choosing from various characters in the animation.

Twister Collectible

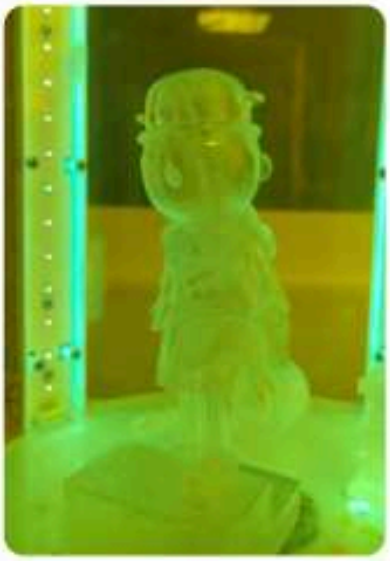

The Twister collectible model was 3D printed with resin in IADE's lab. the 3D model was created in Blender and then exported for 3D printing. the first attempt at printing, however, was unsuccessful as the model had internal cavity issues, making it unsuitable for 3D printing.

Instead, the second attempt was made by making adjustments to the model through the support of one of our professors, Professor João Santos from Digital Studio III, who made it possible for us to have a working model with no errors.The model was then painted by first applying a primer and then acrylic paints. We also developed exclusive packaging using the same color palette, on which is shown the Twister model with various descriptions attached.

First model (failed)

Final model

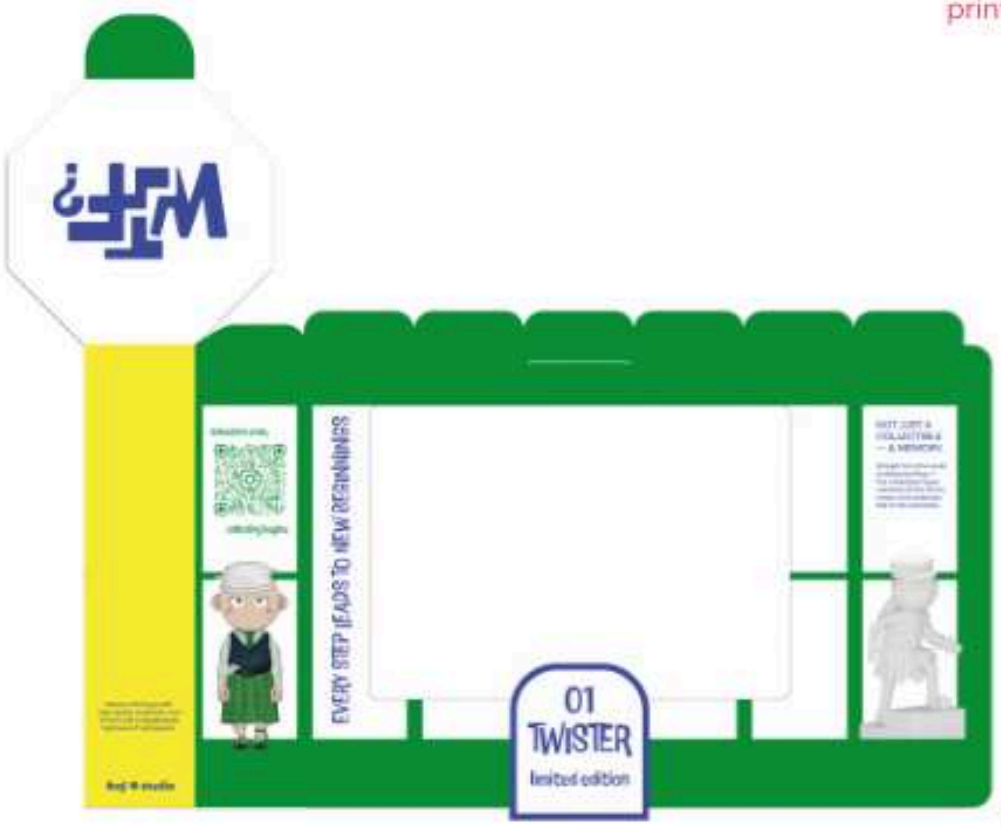

Twister Collectible

The design of the packaging box takes inspiration from the iconic octagonal pillars found at the entrance to IADE. The developed packaging was therefore created using the same shapes and colors as the original pillars, with slight variations regarding the window for viewing the collectible. Descriptions use a playful and friendly tone of voice, echoed throughout the animation and design.

07 digital kiosk

Digital Kiosk Ideation

07

7.1 User research

User Journeys

The following image shows three user journeys that outline how our expected users (students, professors, and IADE community members) engage with the kiosk and its interface, ensure that the kiosk meets their needs and fulfills its purpose. Each user journey was structured with the following phases:

- **Awareness:** How the user first learns about the digital kiosk.
- **Consideration:** The motivations and expectations leading them to engage with the kiosk.
- **Decision:** The moment they choose to interact with the kiosk at the event.
- **Use:** How they navigate and explore the content presented.
- **Retention:** The impact of the experience and its influence on future engagement.

As you can notice in the table below, for students, the kiosk can provide inspiration and learning opportunities; for professors, it can act as a reference for student development; and for IADE community members, it showcases the success of interdisciplinary collaboration project for the college.

By analyzing these touchpoints, we can refine our kiosk's design and content to ensure accessibility and engagement with our show.

User's journey map

	Awareness	Consideration	Decision	Use	Retention
Student 2nd-year Spanish International Design Student	• Hears about show through other classmates and friends. • Notices kiosk on the side on space after animation is complete.	• Curious about results of cross-project. • Wants to see friends project about IADE. • Wonders if the show is in English.	• Attends videomapping show and later approaches kiosk. • Explores interface, finding interesting explanations in certain moments in the animation. • Watches behind-the-scenes clips of his friend with group creating the show.	• Interacts with IADE history timeline, learning about the previous building. • Explores the other interactive elements seeing the 3D models and concept moodboards. • Uses interactive map to find where the tech lab is (mentioned in animation). • Changes language setting to Spanish.	• Visits tech lab, meeting technician, considering going there again for a personal project. • Shares feedback of show with friend and of details from the digital kiosk, including how great it was to have a version in Spanish.
Professor Animation Professor	• Has students involved in project, so is aware. • Receives an email from the Project coordinator inviting to join the event.	• Wants to see the various directions her students took and the final results. • Has to grade their work in terms of the animation development. • Wonders if students employed techniques taught in her class.	• Attends event and visits kiosk after. • Should spend shorter time in order to visit all the others.	• Explores kiosk sections about the development of project, where the students' process is highlighted. • Takes notes of projects and thoughts related to final animation and process.	• Share thoughts about interesting full show elements that complement animation experience with other professors and with the project coordinator. • Congratulates and gives feedback to students.
IADE Direction Member Global Design Course Coordinator	• Organized event date. • Receives reminder from Project Coordinator to be present.	• Interested in seeing the development and ideas of this year's students. • Curious of the direction students took towards the theme being IADE and its legacy or campus change.	• Attends event watching the animation and later heading towards kiosk to see what it has. • Explores available sections to see what options are available.	• See sections with students name and behind-the-scenes work. • Checks interactive map, finding a wayfinding system and guidance for directions around university building. • Check animation curiosities section to understand specific student experiences shown in the animation.	• Congratulates and asks questions to students about their work. • Follows-up with Project Coordinator about her thoughts and feelings about the results of the full videomapping show experience.

User Survey (alternative method)

The last method we used was a user survey. This approach allowed us a better connection between us and our participants as well as some very specific answers regarding their experiences with digital kiosks.
The following screenshots will show the whole survey, and furthermore, its analysis.

Secção 1 de 5

Kiosks' Experiences (Experiências com Kiosks)

B I U

EN
Hey there,
We are inviting you to share your own experiences with digital kiosks for data gathering purposes. For those who don't know what a digital kiosk is, we'll give you the example of the McDonald's digital devices, where you order your own food. That is the most generic example. You have plenty of other examples, which you will remember later, while responding to the questionnaire.
This questionnaire aims for helping us understand how a digital kiosk can work, according to user's needs and satisfaction, as we will develop one for our Project UC's exhibition, at IADE.
Your help is very much appreciated!

PT
Olá,
Convidamo-vos para partilharem connosco as vossas próprias experiências com kiosks digitais para recolha de dados. Para os que não sabem o que é um kiosk digital, vamos dar-vos o exemplo dos ecrãs digitais do McDonald's, onde podem pedir a vossa comida, que é o mais genérico. Existem muitos outros exemplos, que se irão recordar mais tarde, conforme vão respondendo ao questionário.
O objetivo deste questionário é ajudar-nos a perceber como é que um kiosk digital deverá funcionar, de acordo com as necessidades e satisfação dos seus utilizadores, uma vez que iremos desenvolver um kiosk para a nossa exibição da unidade curricular do Projeto, no IADE.
A vossa ajuda será muito agradecida!

24 respostas

Todos os exemplos que dão são boas sugestões. Não adicionaria mais nada.

Timeline

Interviews, the inspiration behind the creation of the characters and story, the story would definitely be useful info to include as well. Better not to add much content or it might get a bit boring.

Não sei.

I'd say (from the examples): interviews, what inspired us into creating the characters/story, directions inside the building.

Survey Analysis

After taking a look at the survey's results, we noticed that the majority of our respondants were teens and young adults that are still students, meaning that the most people who answered are from a more recent generation and share more similar values. However, the three older participants we got still vary in terms of age.

Moving to the McDonald's section, it's visible that only a very small percentage of our respondants never ordered at a kiosk, which corresponded to only one individual. Perhaps this happened because they either never attempted to order at the digital machine and preferred the traditional way of ordering at the counter, or simply because they have never had one of these kiosk machines at their closest store, possibly coming from more rural or less populated areas where stores like this might not yet have been modernised.
On the section's second question, we can see that most people found it either easy or very easy to order at a digital kiosk. We believe this has to do with the majority of our participants being from a younger generation, which is very connected to technology, and consequently making it an easier experience to order in the machines.

The third question gave us some really interesting results, as we were not expecting to see a decent amount of people saying that it felt irrelevant for them to either order at the kiosk or the counter, taking into account the amount of participants that are not from the younger generation (3).

We had 4 people saying that they prefer to order at the counter, which we believe are the 3 older participants and surely the person who never ordered at a kiosk. As we believe that the people who said they preferred to order at the kiosks are from the younger generation, meaning that they are very overall connected to technology, it felt surprising to see that some of them don't mind the old method of ordering at the counter.
For the fourth question, although some people still prefer ordering at the counter, the results for their kiosks were quite positive, as we didn't receive any answers that revealed difficulty in utilizing the machines, meaning that they are clear enough regarding the way they organized the ordering machines.
Finally, for the last McDonald's question, only one person voted that they are not very content about their kiosks, while the other 23 participants are either neutral, satisfied or very satisfied about the kiosks performance, confirming the previous question about it's clearance and overall good quality.

The next and last user experience section is the shopping malls' wayfinding kiosks. We started by asking our participants if they had ever used a kiosk at a mall to find a store, to which we got all kinds of answers. The majority of them actually utilized the wayfinders at some point, however, almost half of them either don't recall using them or had never used them.

This leads to the conclusion that probably not many malls have that function yet, or either placed few kiosks or displayed them poorly, which makes people not noticing them and ending up asking someone where the store they are looking for is located at.
On the next question, we can see that oddly the majority of people are unsure or neutral about the kiosks' functionality, meaning that the display is probably not very clear in general. This problem reflects on the third question's results, as the majority of our respondents prefer to either looking for the stores on their own or asking around. Although a large portion of people said that both options worked for them, it's interesting to see that only 8% of them said they find the kiosks useful. This reflects on how unappealing, less impactful and efficient the kiosks at shopping malls are, in comparison with food ordering kiosks.
The fourth question gave us an overall positive feedback regarding the kiosks' clear directions and aesthetics, as about 2/3 of our participants gave it a "useful" and "very useful" answer. Otherwise, about 1/3 of the respondents appeared to be neutral, which still represents a significant amount, meaning that although the majority of our feedback is positive, a large portion of people feel indifferent about the machines' directions.
The fifth and final question confirms our thoughts about the third question: people seem not to care much about mall kiosks, unlike they do with the McDonald's ones. Their functionality isn't as efficient, which is why many people don't find them very relevant or useful.

In conclusion, the survey's findings offer crucial information that will direct our digital kiosk project's design choices.

It is clear from the McDonald's kiosk area that well-designed digital kiosks are popular, especially with younger, technological consumers. Just one participant reported never having used a McDonald's kiosk, indicating that these devices are already a standard feature of the user experience. The significance of intuitive, user-centered design is highlighted by how simple it is for the majority of responders to utilize these kiosks.
The popularity of McDonald's kiosks further emphasizes how important responsive interfaces and easy navigation are. Simplicity, clarity, and smooth interactions must be given top priority while designing a kiosk in order to minimize friction and offer a seamless user experience.

However, there is need for improvement based on the conflicting opinions of mall navigation kiosks. Numerous respondents indicated problems with visibility and placement, since they either never noticed or did not remember utilizing these kiosks. This highlights that in order to boost engagement, physical areas must be positioned strategically. Furthermore, the ambiguous or ambivalent comments regarding their use point to a lack of clarity or intuitive design. Our kiosk's interface must be aesthetically pleasing and offer simple, unambiguous navigation that promotes interaction.

There is a noticeable difference in how people think about McDonald's and mall kiosks. Mall kiosks frequently fall short of providing the same degree of usefulness as McDonald's kiosks, which are seen as effective and necessary.

Our design must put an emphasis on providing quick, observable advantages through transparent communication and simple instructions in order to close this gap. Considering all things, four fundamental design elements will be our main focus going forward: providing genuine value, strategic positioning, user-friendly interfaces, and intuitive navigation. By following these guidelines, we may design a digital kiosk that not only satisfies user requirements but also improves their experience, promoting a better engagement.

User Personas

In order to define our digital kiosk key features that would align with our visitors/ clients/ users expectations, we created three main personas. They are appropriate for all 3 **leader user groups** in IADE.

Persona #1

Emma Hall

Age: 20 years old | Nationality: English

Occupation: Student | Accessibility Needs: No disabilities

Education: Undergraduate in Global Design

User Familiarity: has been studying in IADE for two years. often visits various events in the university and is a member of TUNA

Challenges

- Navigating the IADE building, especially when events or exhibitions change locations.
- Finding relevant background information about the video mapping show that aligns with her coursework.
- Balancing a packed academic schedule with extracurricular activities.
- Using systems that are only in Portuguese.

Goals

- Efficiently navigating the campus to maximize productivity.
- Staying informed about upcoming exhibitions and events.

Motivation

- Enhancing her knowledge of IADE's artistic and historical context.

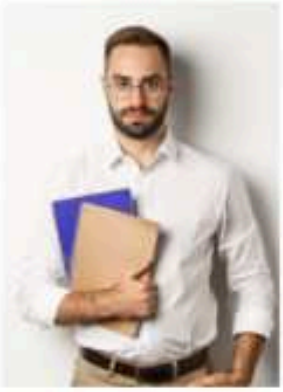

Key Features / Needs

- Easy ability to locate herself all around university.
- Have translation options or English versions available.

Interests / Hobbies

Needs an efficient way to find classrooms, auditoriums, and event spaces. Interested in interactive and visually engaging content. Loves finding out something new and explore new spaces.

Persona #2

Miguel Kravitz

Age: 46 years old

Occupation: Professor

Nationality: Portuguese

Accessibility Needs: No disabilities

Education: Lisbon Art University

User Familiarity: Has been teaching in IADE for almost a decade.

Challenges

- Wants a reliable resource to direct students to historical and artistic references.
- Sometimes struggles with remembering event location or exhibition details.
- Prefers clear, structured navigation over overly complex digital interfaces.

Motivation

- Enriching students' understanding of IADE's artistic and historical contributions.
- Efficiently accessing location details for lectures, exhibitions, and meetings.

Goals

- Integrating digital resources into his teaching approach.

Key Features / Needs

- Needs a quick way to check and communicate updates on wayfinding and event schedules.
- Looking for an accessible, reliable kiosk that reduces the need for manual assistance.

Interests / Hobbies

Prefers text-based explanations over highly interactive or gamified experiences.

Persona #3

Anna Kliff

Age: 38 years old

Occupation: IADE staff member

Nationality: Brazilian

Accessibility needs: Moderate myopia

Education: Computer Science in LBc

User Familiarity: Has been helping coordinate events, exhibitions, and visitor experiences. She is responsible for assisting students, faculty, and external guests in IADE for four years.

Challenges

- Answering frequent location-related questions from students, visitors, and faculty.
- Ensuring guests have a smooth experience navigating IADE's spaces.
- Managing last-minute changes in event locations or exhibition setups.
- Reading very small text in screens with low luminosity.

Motivation

- Enhancing IADE's reputation by ensuring a smooth visitor experience.
- Making it easier for staff to update or retrieve information quickly.

Goals

- Improving operational efficiency by reducing repetitive inquiries.

Key Features / Needs

- Needs a quick way to check and communicate updates on wayfinding and event schedules.
- Looking for an accessible, reliable kiosk that reduces the need for manual assistance.
- Large enough fonts sizes & normal to high screen brightness adjustments.

Interests / Hobbies

Interested in features that improve visitor experience, such as multilingual support.

User interviews

After identifying who the ideal users of our digital kiosk are, we proceeded to conduct a series of interviews and field research, asking the **direct users** and target audiences of the digital kiosk for **opinions** on what they would like to integrate into a hypothetical interface, what their interests and expectations were in this regard.

The interviews are **semi-structured**, with some topics preset conversation cues, leaving respondents free to express their opinions and thoughts about the topics expressed.
Fruitful results then emerged from each interview, focusing on new **suggestions** that could be, in addition to being interesting for the user to view, the fruit of **improvement** to implement useful features to help the user in navigation.

How will we apply the interviews to our digital kiosk?

Although many of the responses coincided in terms of ideas and proposals, based on the responses obtained from the various interviews we were thinking of integrating the following functions within the kiosk:

- interactive map
- "dear future IADE" section
- fun facts and curiosities section
- student short testimonies about their experience

some of the answers...

"I'm feeling lucky"

"i think the best thing would be having a description and **fun facts** about the courses, maybe some students that would like to leave a message about their works in their specific courses and maybe talk about some teachers too,
I would love to learn a little bit more about what are the other students making"

"where am I?"

"I think implementing an **interactive map** could be really interesting to be able to improve life on campus as well. I remember the first day of college I was completely lost and didn't know where to go, it would be **helpful** to know more about the university before starting classes"

"how did we end up here?"

"I think you could implement more technological interaction systems, or even a space dedicated to telling the history and **evolution of technology** to the present day, it would be very interesting"

"dear future IADE"

"I like the idea of **leaving messages for future students** because many people sometimes come to visit the college before applying, but just by talking to those who study at IADE can tell **what it is really like to study here**"

7.2 Benchmarking

Digital Kiosk - Market Research

In order to complete our benchmarking research, we considered the best format for it to be a table where we could more easily group other existing kiosk models of possible **competitors** and available products in the **market.** With this list we created our version of a **SWOT analysis** that could highlight the good and bad characteristics of each machine with their specific **UI requirements** and **usability purposes**. The images below attempt to show this analytical research, but below them there is also a link open to the Google Sheets file for better visualization, if needed.

Link to Google Sheets table:
https://docs.google.com/spreadsheets/d/15EcTLMuxXWyFpkTHfnD2EhlcBQoZ8SHfPRnYPSNjWSs/edit?usp=sharing.

With a complete breakdown of these already existing kiosks that function for a variety of purposes, we reckoned it was of great value to understand and point out some strategic insights that each of the examples grouped could offer for us, as well as how we could possibly implement them in our kiosk for our videomapping show.

Insights (1) & implementation (2) strategies:

- NOS Cinema, GoldCar, Natural History Museum & McDonald's kiosks
    - 1- Engaging UI with simple categories and easy navigation using common terms keeping users immersed and not frustrated.
    - 2- Have clear categories (videomapping contents/curiosities, IADE history, building wayfinding) & interactive storytelling features (animated transitions, interactive and customizable maps, easy to back back buttons).

- Asian Art Museum, Turkish Airlines & IKEA kiosks
    - 1- Support multiple languages, but lack more accessibility features, limiting users.
    - 2- Include text-to-speech functions, ensure color contrast and centered important information, have multilingual options (minimum English and Portuguese for native users and international students), labeled icon navigation to simplify navigation.

- Norte Shopping & Asian Art Museum kiosks
    - 1- Effective wayfinding systems with visual and written directions.
    - 2- Have interactive and customizable IADE building map with direction guidance and easy searchable rooms/labs, include QR code to save directions on phone, "you are here" visual markers and path direction.

- Hungarian National Gallery Magic Wall & Natural History Museum kiosk
    - 1- Interactive historical content, variety of learning directions, educational materials, etc.
    - 2- Have curiosity features for specific moments of animation, interactive timeline for IADE's history, behind-the-scenes animation development image portfolio (animation construction).

- IKEA & McDonalds kiosks
    - 1- Personalization of content with customization of content offers
    - 2- Implement interest selection topics offering a customized journey feature, visualize elements of animation (characters, 3D spaces, etc).

By developing this benchmarking comparison, we are able to have a vaster and more informed view of the existing digital kiosks, as well as what make them good or not in terms of their interface and user-specific usability.

7.3 Key functionalities

Content Videomapping Show

In order to get our future visitors' attention and curiosity, we thought about adding a variety of different functions to complement and support our short film. The following bullet points will help you understanding our key functionality ideas.

- **Videomapping concept art & inspiration**: Here, we would like to include how we thought about our main and secondary characters, concept art and inspiration showing our initial sketches and talking about their personality traits.
- **Behind the Scenes**: We believe it would be interesting to show our visitors our work process and progress, as a team.
- **Yearbook like section with photos of the IADE in this building**: As a "goodbye" message of this campus.
- **Our team members**: Each member's skills and participation on the project.
- **QR code scan**: We want to include a QR code method to allow our visitors to get a deeper information and the building's map, without having to stay near the kiosk, allowing other people to view it at the same time.
- **"Easter Eggs" Exploration section**: Showcase in an explorative way the details, traditions, curiosities and elements of IADE's student experience shown in our short film and more.
- **Section for interaction and comments**: Section destined to allow users to share their reactions to our videomapping show, while also seeing what other people have previously shared too.
- **Our studio's background**: An explanation about our studio, IKAF* studio.

Overall, we believe this will be a good approach to our kiosk, helping our visitors to better connect with the show, us as a team, our story and IADE's history. Having this said, we will try to make this as interesting, interactive and an engaging experience to our audience.

Interactive Wayfinding Map

Developing an interactive wayfinding map for IADE University's video mapping show requires careful planning and design. We came up with those few key points to consider:

1. User-Centered Design Approach.
 • Conduct user research to understand visitor needs and navigation challenges.
 • Design an intuitive, visually appealing interface with clear navigation options.
 • Ensure accessibility with multilingual support, high contrast, and adjustable text sizes.

This is why we have come up with user personas earlier that will help us to define and work on the appropriate user design approach.

2. Interactive Building Map.
 • Touchscreen-enabled map with zoom and pan features.
 • Search function to quickly locate rooms, exhibitions, and event areas. (As we cameo a conclusion that students, who even though have been studying in IADE for a couple of years, cannot navigate throughout the university properly.

3. Key Wayfinding Features.
 • Highlighted exhibition areas and event locations.
 • Step-by-step navigation with animated route guidance.
 • Emergency exits and accessibility routes clearly marked (in case of emergencies).

4. Integration with Video Mapping Show.
 • Interactive elements tied to the storytelling of IADE's history.
 • Contextual content that aligns with the video mapping theme.

5. Additional Engagement Features.
 • Event schedules and notifications for real-time updates.
 • Visitor feedback system for continuous improvement and user based advertisement.

6. Technical Implementation.
 • Touch-responsive UI optimized for kiosks.
 • Integration with IADE's digital ecosystem for seamless user experience and clear, good looking design.

7.4 Accessibility

WCAG

Web Content Accessibility Guidelines (WCAG) were developed by the Web Accessibility Initiative (WAI) under the World Wide Web Consortium (W3C). Their primary goal is to ensure that web content is **accessible** to people with **disabilities** and adaptable to various devices.

Compliance with WCAG is essential for meeting legal requirements such as the Americans with Disabilities Act (ADA). More importantly, following these guidelines enhances **user experience** by making digital content more **inclusive** and easier to navigate for all users.

WCAG Conformance Levels

Level A

he interface is accessible to **some** users (Basic Accessibility Compliance)

- Addresses the most critical accessibility barriers.
- Not using color alone to convey meaning.
- Ensure all functionality is available through a keyboard.

Level AA

he interface is accessible to **almost all** users. (Enhanced Accessibility Standards)

- Aims to make content accessible to most users.
- Minimum color contrast ratio of 4.5:1.
- Text Resizability: Allow text scaling up to 200% without breaking layout.
- Provide Captions: Required for all pre-recorded multimedia content.

Level AAA

The interface is accessible to **all** users (Maximum Accessibility Compliance)

- Ensures the highest accessibility standards.
- Enhanced contrast ratio of 7:1 for users with severe visual impairments.
- Allow text customization: Users should modify line spacing, colors, and fonts.
- Provide sign language translations for multimedia.

The POUR Principles

In accordance with Web Content Accessibility Guidelines, we have decided to adhere to the **AA level** of accessibility by implementing and carefully curating the following guidelines within our digital kiosk. The guidelines are presented according to the POUR principle, as they appear within the WCAG guide:

Perceivable

Ensures that users can perceive the information presented.

- **Color Contrast:** Maintain a contrast ratio of 4.5:1 for readability.
- **Alternative Text:** Provide meaningful alt text for images to assist screen reader users.

Example: Captions for videos help users with hearing impairments.

Operable

Users must be able to navigate and interact with content.

- **Avoid Time Limits**: Users should have enough time to read and interact with content.
- **Focus Indicators**: Highlight links and buttons to aid users with limited mobility.

Example: Keyboard Navigation ensures usability without a mouse.

Understandable

Content should be clear and easy to comprehend.

- **Consistent Navigation**: Maintain predictable layouts and workflows.
- **Error Identification**: Provide immediate feedback and suggestions for correcting mistakes.

Example: Clear Headings and Labels improve usability.

Robust

Content must work across various devices and technologies.

- **Semantic HTML:** Use proper tags to structure content meaningfully.
- **Future-Proofing:** Ensure content adapts to evolving web technologies.

Example: Proper markup for status messages ensures updates are communicated to screen readers.

Perceivable

Kiosk color palette contrast

In accordance with **WCAG's Success Criterion** 1.4.3 - Contrast (Minimum):
The visual presentation of text and images of text has a contrast ratio of at least **4.5:1**, except for the following:

Large Text
Large-scale text and images of large-scale text have a contrast ratio of at least **3:1**;

Logotypes
Text that is part of a logo or brand name has no contrast requirement.

Incidental
Text or images of text that are part of an inactive user interface component, that are pure decoration, or that are part of a picture that contains significant other visual content, have no contrast requirement.

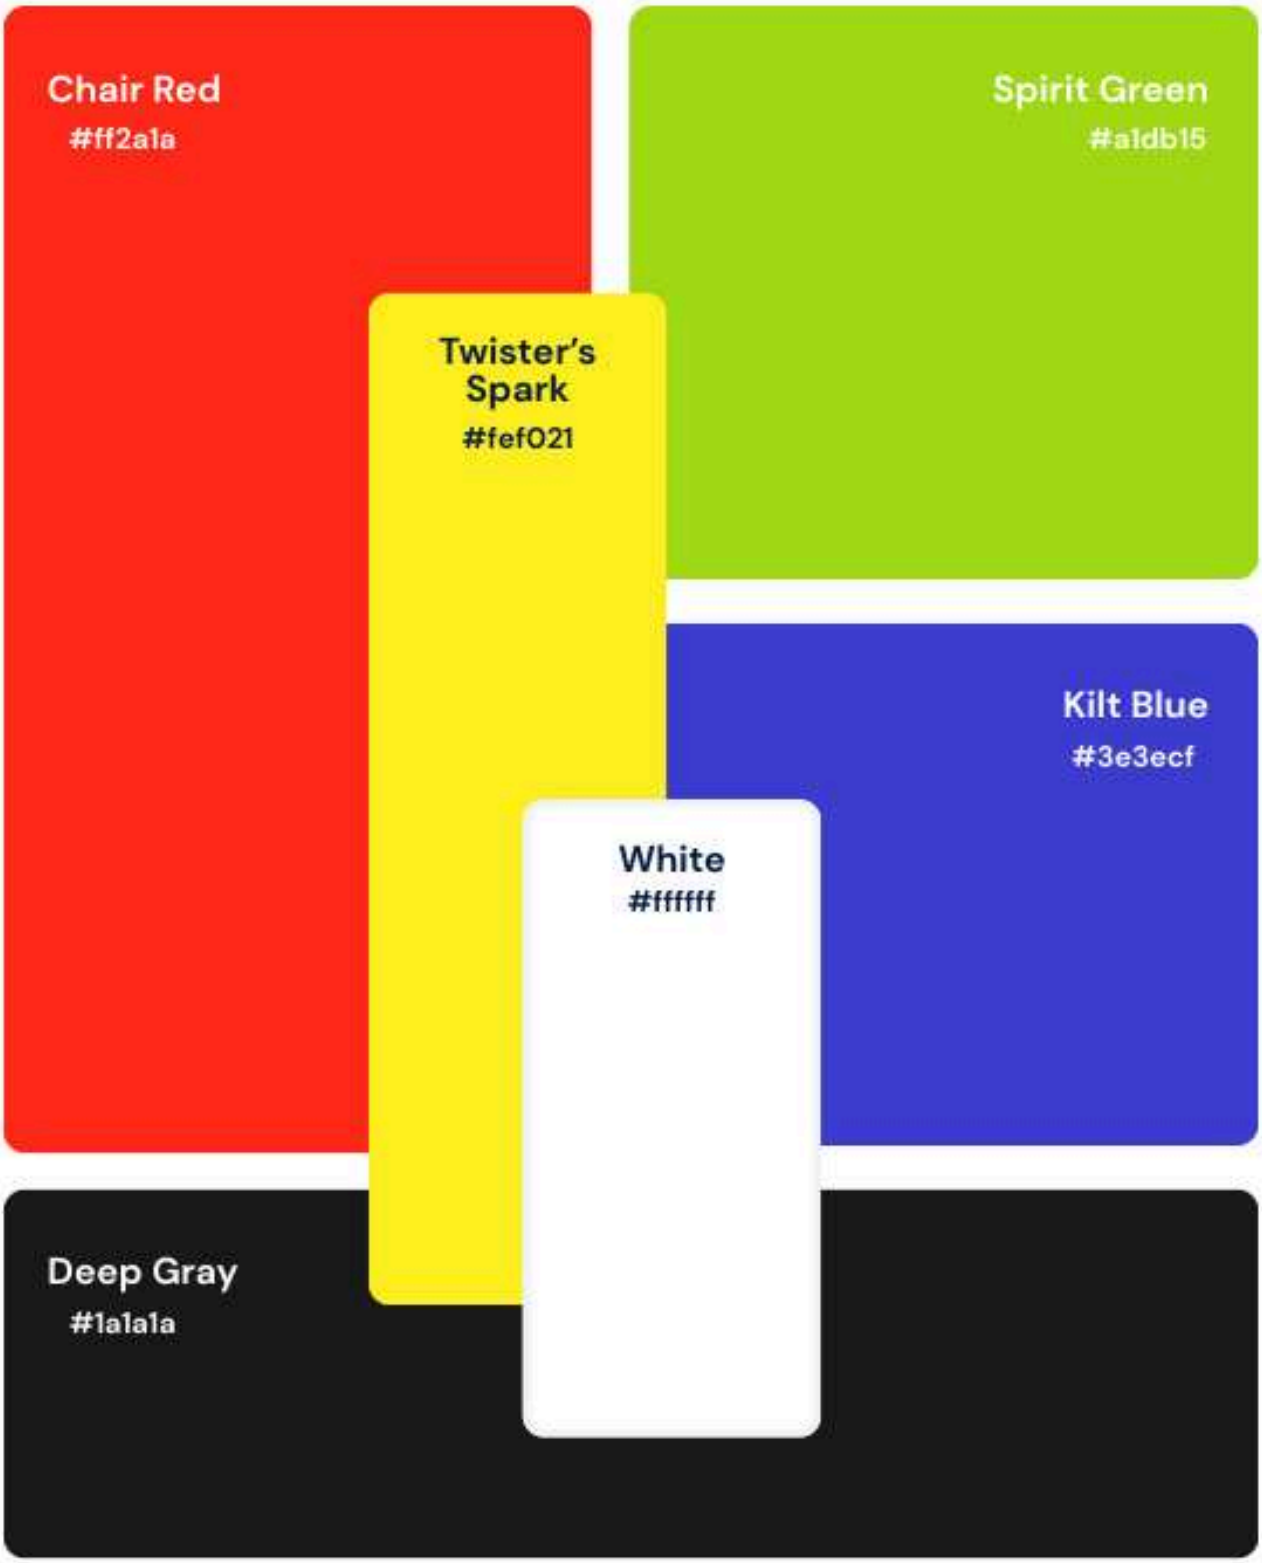

In accordance with **WCAG's Success Criterion** - 1.4.11 Non-text Contrast:
The visual presentation of the following have a contrast ratio of at least **3:1** against adjacent color(s):

User Interface Components
Visual information required to identify **user interface components** and states, except for inactive components or where the appearance of the component is determined by the user agent and not modified by the author;

Graphical Objects
Parts of **graphics** required to understand the content, except when a particular presentation of graphics is essential to the **information** being conveyed.

Color blindness simulator

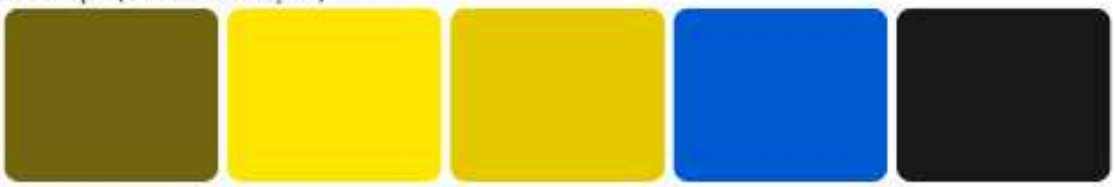

Original color palette

Deuteranopia (lack of green receptor)

Protanopia (lack of red receptor)

Tritanopia (lack of blue receptor)

The palette is suitable for colorblind vision ☑

Text Spacing

Success Criterion 1.4.12 – Text Spacing

In content implemented using markup languages that support the following text **style properties**, no loss of content or functionality occurs by setting all of the following and by changing no other style property:

Line spacing	1.5 times the font size	Letter spacing	0.12 times the font size
Paragraph spacing	2 times the font size	Word spacing	0.16 times the font size

Text Alternatives

Guideline 1.1 Text Alternatives

Provide text alternatives for any non-text content so that it can be changed into other forms people need, such as large print, braille, speech, symbols or simpler language.

All non-text content that is presented to the user has a text alternative that serves the equivalent purpose.

Operable

Pause, Stop, Hide

Success Criterion 2.2.2 – Pause, Stop, Hide

For moving, blinking or scrolling information, all of the following are true:

Moving, blinking, scrolling

For any moving, blinking or scrolling information that starts automatically, lasts more than five seconds, and is presented in parallel with other content,

there is a mechanism for the user to pause, stop, or hide it unless the movement, blinking, or scrolling is part of an activity where it is essential;

Headings and Labels

Success Criterion 2.4.6 Headings and Labels

Headings and labels describe topic or purpose.

Pointer Gestures

Success Criterion 2.5.1 – Pointer Gestures

All functionality that uses multipoint or path-based gestures for operation can be operated with a single pointer without a path-based gesture, unless a multipoint or path-based gesture is essential.

Understandable

Language of Page

Success Criterion 3.1.1 – Language of Page

The default human language of each Web page can be programmatically determined.

Consistent Navigation

Success Criterion 3.2.3 – Consistent Navigation

Navigational mechanisms that are repeated on multiple linked pages occur in the same relative order each time they are repeated, unless a change is initiated by the user.

In a few words...

How will we apply the guidelines to our digital kiosk?

IKAF* studio's digital kiosk will:

(for the interface)

- be colorblind friendly
- have a high color contrast ratio
- have a simple and user friendly UI

(for user support)

- support multiple languages
- include text-to-speech functions
- have a variety of learning directions, educational and interactive materials

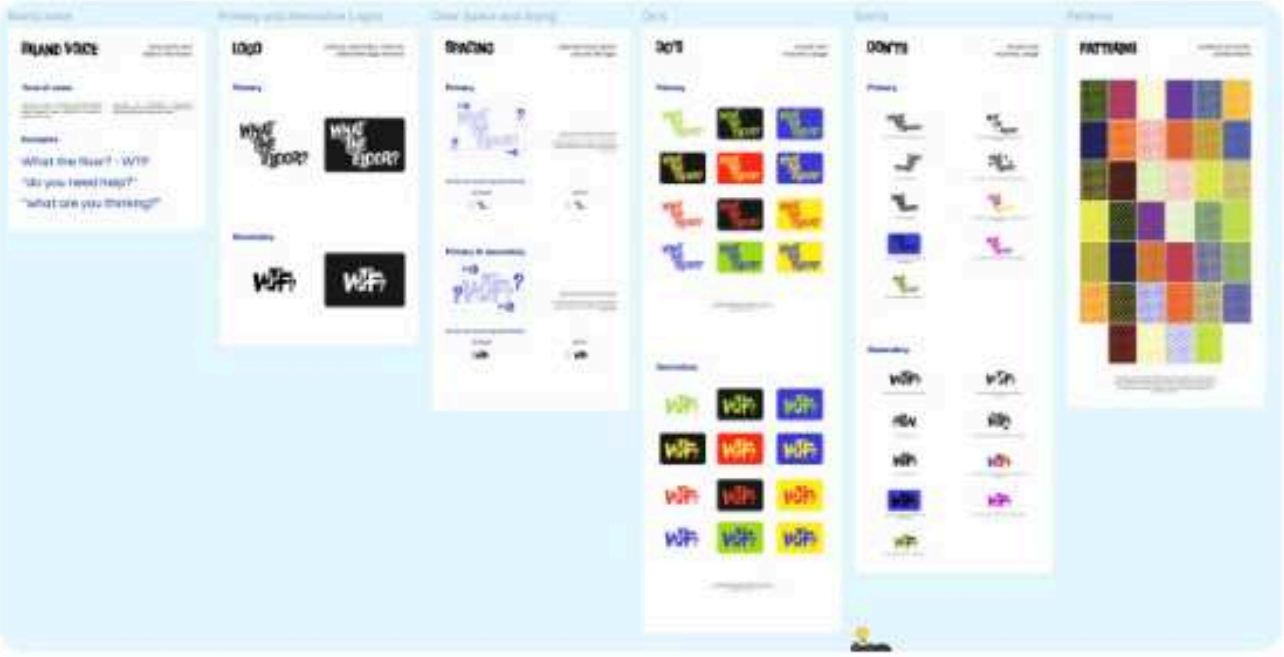

(for wayfinding and navigation)

- have visual markers and path direction
- have a very simple search system for rooms and labs
- have an effective wayfinding system with visual and written directions

7.6 Design system

To access the design system on Figma, use this link:
https://www.figma.com/design/ZCZFh1aqlagkNFzMb3I57f/WTF--DESIGN-SYSTEM?node-id=69-6030&t=nYsckubesiaXrkZ1-1

Foundations - Logos

In the first part of the fundamentals, we decided to include essential brand information such as:

- **brand voice**
- **logo** (spacing, do's and don'ts, graphic patterns)

This first part indicates the graphic features of using our logo, it is a clear and intuitive **brand manual**, embedded within our digital kiosk.

LOGO

main version

secondary version

Do's

When the logo is used, either in its extended or compact form, different color combinations are acceptable, in accordance with what was previously established in the accessibility option to achieve **AA level of accessibility**.

This allows our place to be **recognizable** in different contexts and with different background colors, while always remaining **distinguishable** and easily **readable**.

Allowable combinations of icons (level AA)

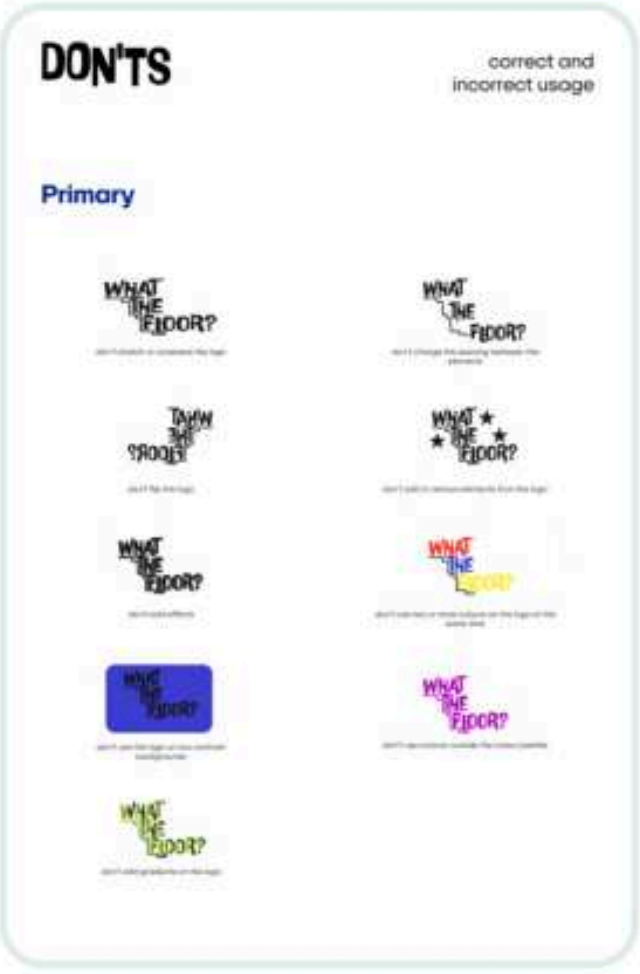

Don'ts

An additional section regarding fundamentals and, in particular the logo, is the **don'ts** section. This section highlights the major instances of logo use that should be avoided to allow maximum readability and accessibility of the logo.

Among these we can find the inability to use multiple colors simultaneously in the logo or, for example, that of not using the logo with low-contrast background colors.

Taking accessibility levels into consideration, it is possible to use different types of geometric background patterns, or, depending on the context of use, low-contrast combinations can be used for backgrounds that do not need a high level of attention.

Instead, at the time when a prominent background is needed, high-contrast combinations can be used (a possible application for example could be the background of a story for Instagram, a digital kiosk page, or elements within it).

Foundations - Color Styles

The color palette for "What The Floor?" has been carefully crafted to balance vibrancy, clarity, and accessibility across an interactive interface. It includes six main color families: Chair Red, Kilt Blue, Twister's Spark, Spirit Green, White, and Deep Gray—each representing a key mood or functional purpose in the visual language. Every color group includes a full spectrum of shades from 50 to 900,

allowing flexible use in both light and dark UI contexts while maintaining strong visual contrast and accessibility (with AA/AAA contrast checks displayed). This system ensures consistency with the animated style of the videomapping experience, while supporting readability, hierarchy, and expressive storytelling throughout the kiosk's interface.

Color Palette

Original color palette

Foundations - Text styles

Regarding text styles, we chose to use three main fonts in different combinations:

Nudgewink - regular

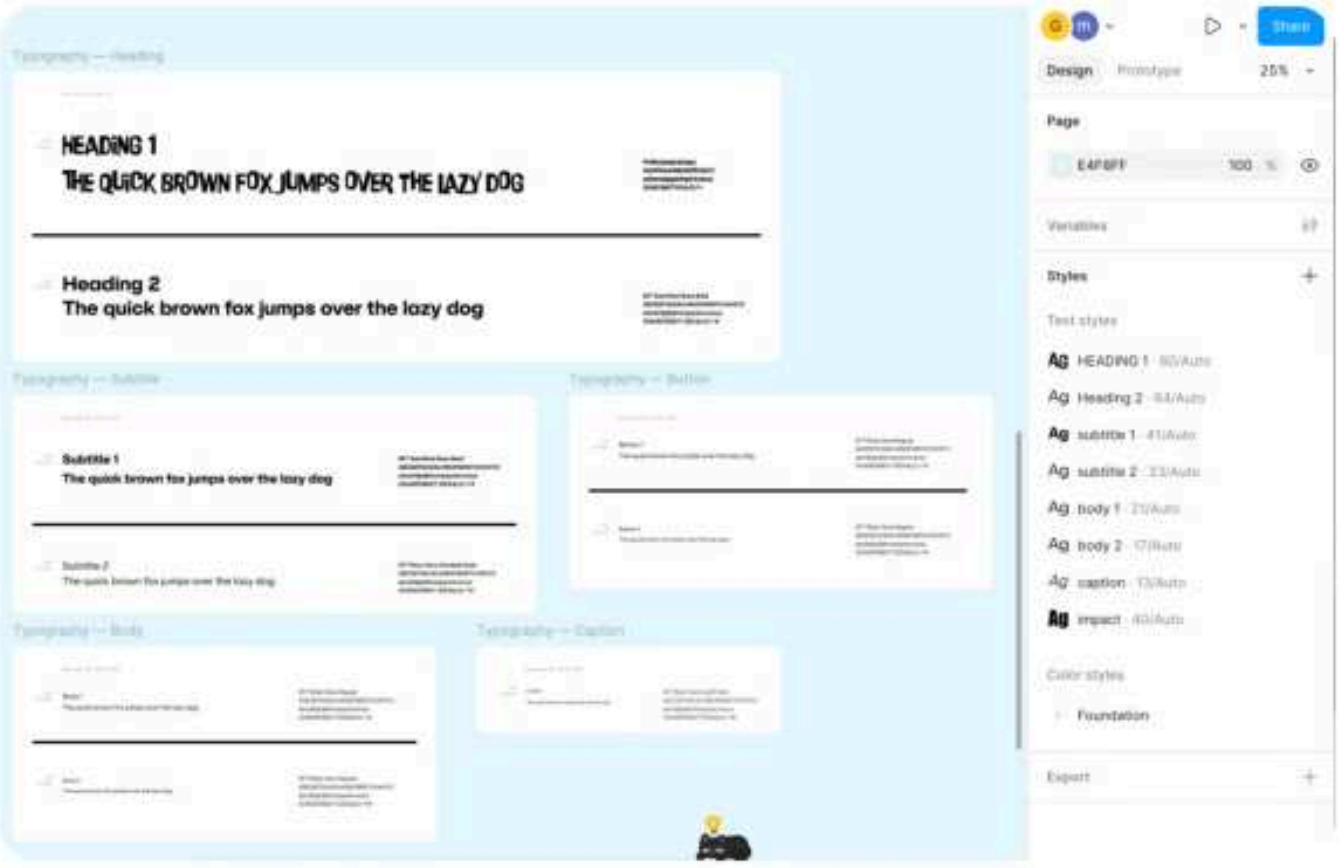

We chose this font for its playfulness. Nudgewink is a font that despite its irregular and misaligned shapes, remains legible but at the same time communicates a sense of "quirkiness".

Used to a restricted extent for main section headings (Heading 1 - 80pt) because it would be unreadable in extended paragraphs of text.

SFT Schrifted Sans

Chosen for its high readability and round shapes, this font is mainly used in context where large paragraphs of text need to be used, as, for example, in digital kiosk.

Used mainly for digital kiosk interface, in different ways. Depending on thickness and size can be used for subtitles (41 pt - bold, 33 pt - regular), buttons and text (21 pt - regular, 17 pt - regular) , captions (13 pt - light italic).

Impact

Chosen for its strong, distinctive character, this font allows us to use text within the video mapping even in areas restricted in width, as it is developed mainly in height.

Used within video mapping for text captions or speech bubbles: for example, onomatopoeias). Within the digital kiosk it can be used in different sizes for smaller elements such as buttons, page directions. The size is variable, so no defined text style has been created for it.

After defining the respective text combinations and their sizes, we created the text styles within the Figma interface so that they could be easily used at any time.

Foundations - Grids

Regarding the grids of the digital kiosk, we organized the space in such a way as to have an intermediate grid that would allow elements to be spaced across the page effectively and consistently. The grid can be used vertically or horizontally, maintaining the same characteristics.

The orientation of the digital kiosk will be landscape, however, there will be vertically scrolling pages where information will be placed. therefore, we felt the need to also identify a grid that would allow use in this mode.

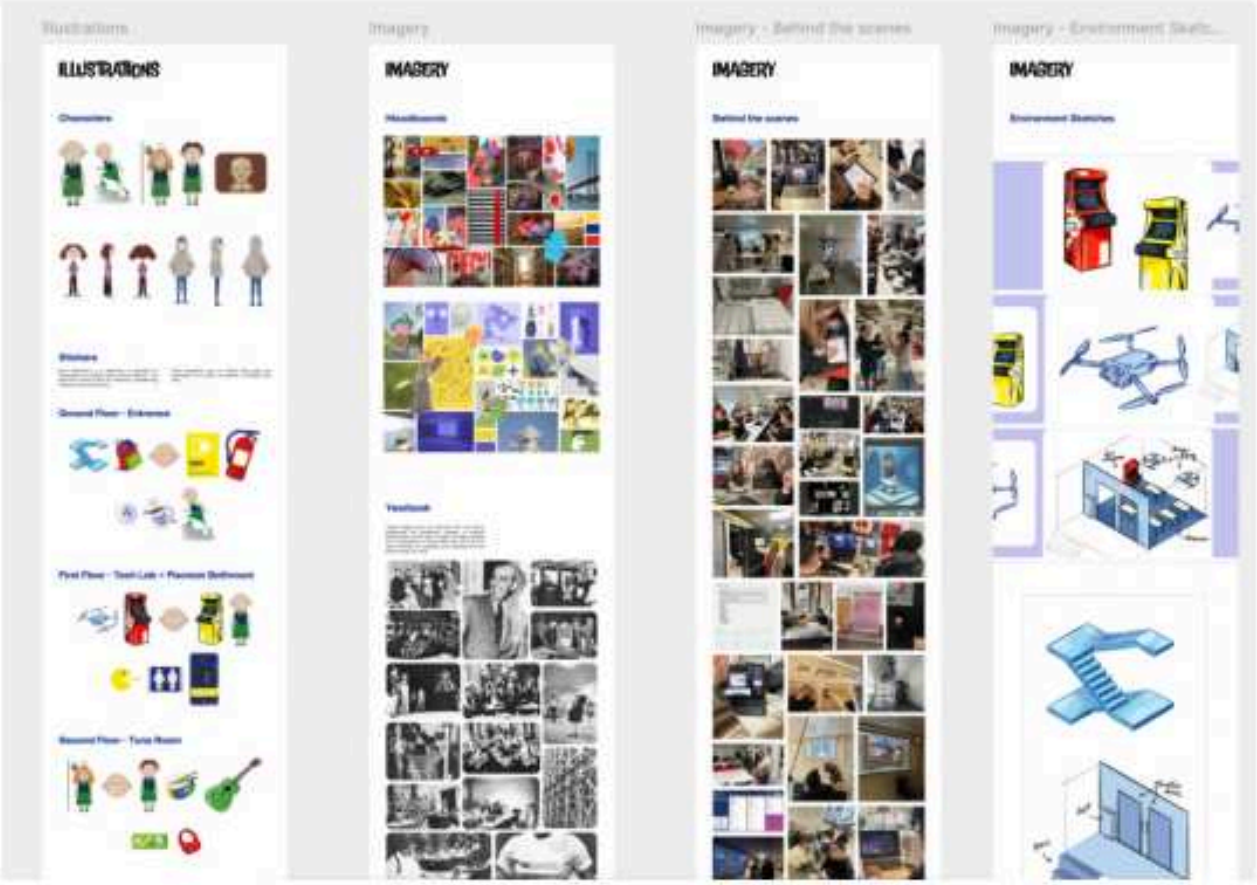

Foundations - Imagery & Animations

The Imagery & Animations section of our design system outlines the visual language and motion principles used throughout the digital kiosk. This flexible structure guarantees visual consistency across different scrolling orientations and screen configurations, allowing various content types—like illustrations, behind-the-scenes imagery, and environment sketches—to be presented with clarity and balance.

The imagery is categorized into distinct sections, including illustrative assets, collage style visual boards, documentary style yearbook photos, and environmental sketches that reinforce the storytelling of each floor.

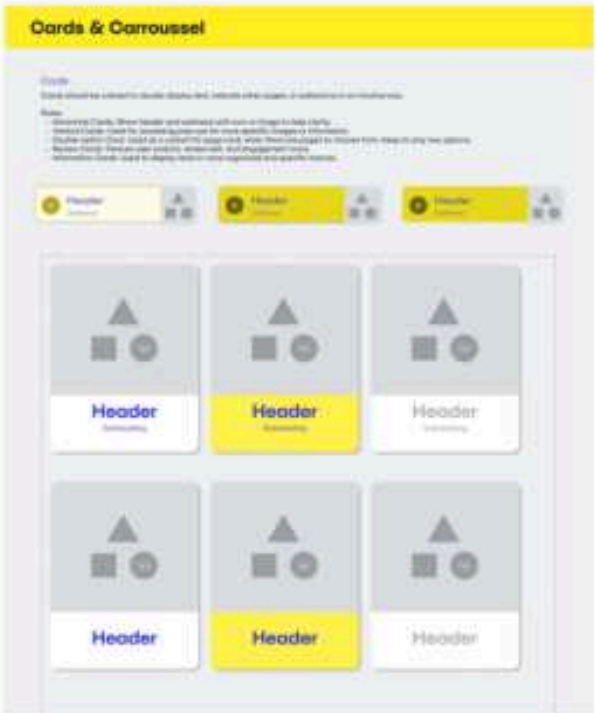

UI Components

The following images show the first version of the UI components section of our design system, where we explain the proper applications of our buttons, card, text, fields, etc. Accessing the Figma link provided above, grant you access to the complete system.

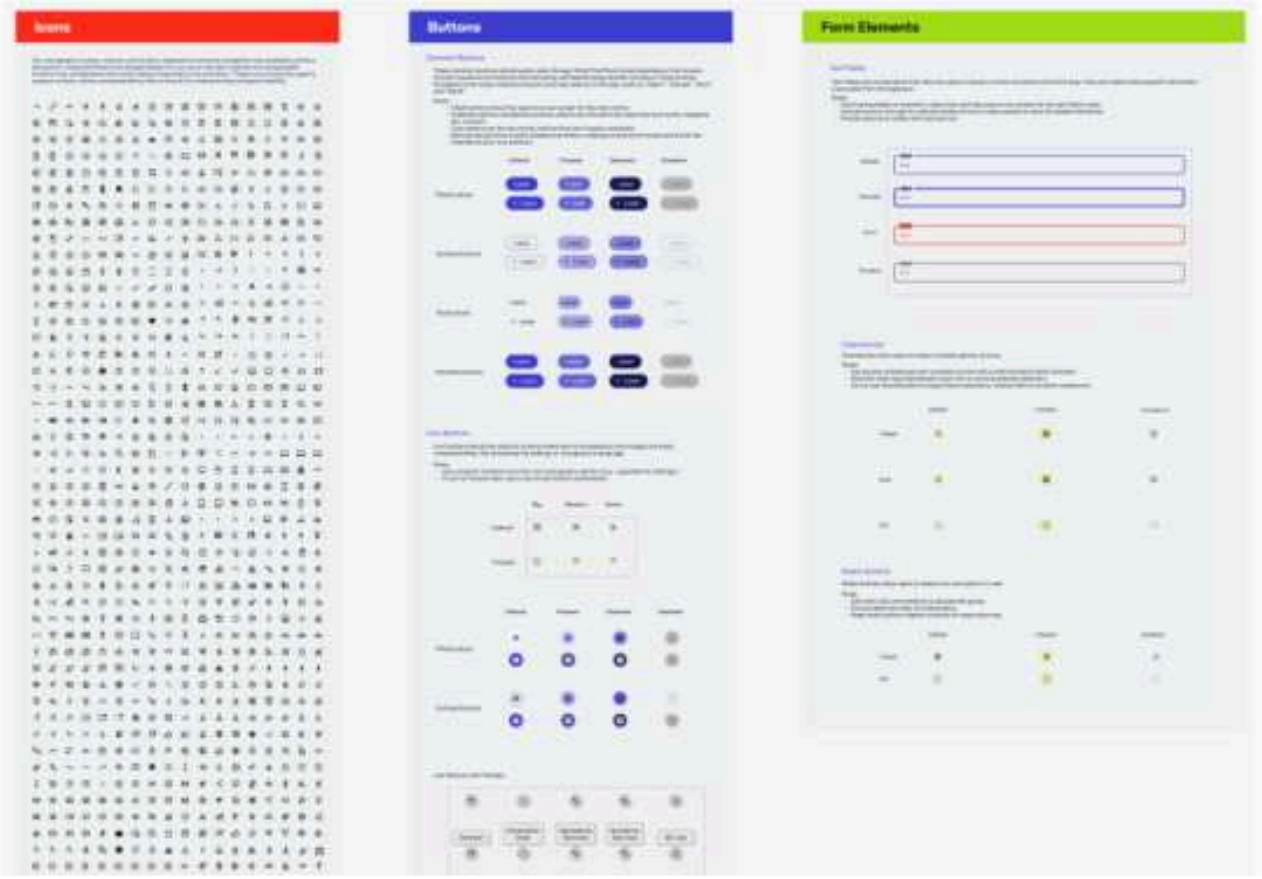

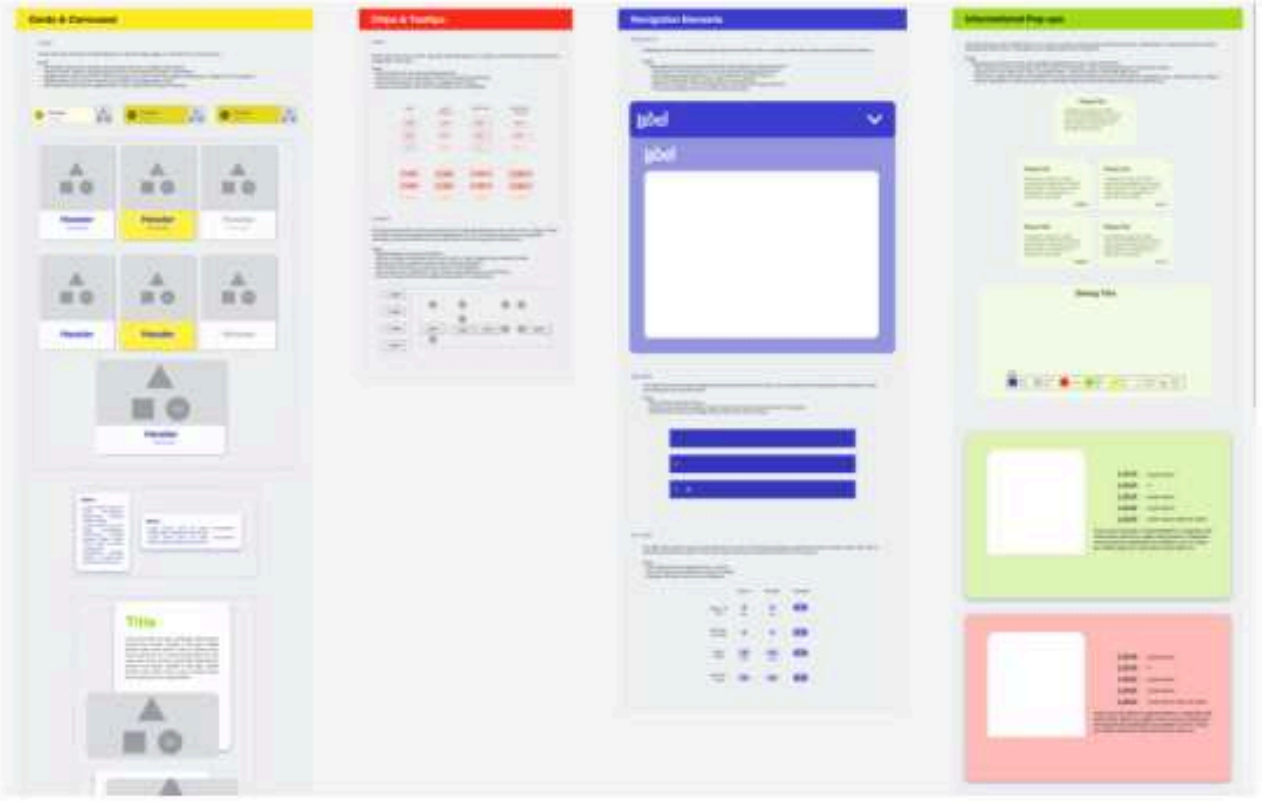

Upon completing our heuristic evaluation and usability testings, we realized that our UI components section needed to be updated according to the changes that were required to be made in our kiosk interface. The following images give a very small insight to the kind of guidance towards using these components for our digital kiosk, but by accessing the link, you get a more comprehensive look at these details.

7.7 Info Architecture

Content Auditory

PAGE 1 - Home Page

What users see:

- A welcoming animation or static design about the movie's logo: "What the Floor?".

Buttons:

- "What The Floor?" → After pressed, leads to page 1.1.
- "About Us (IKAF* Studio)" → After pressed, leads to page 1.2.
- "Interactive Map" → After pressed, leads to page 1.3.
- "Feedback & Comments" → After pressed, leads to page 1.4.

PAGE 1.1 - What The Floor?

What users see:

- An interactive page that allows the viewers to see the animation's process.

Buttons:

- "Character Art & Moodboards" → After pressed, leads to page 1.1.1.
- "Environment Art & Moodboards" → After pressed, leads to page 1.1.2.
- "Behind-the-Scenes" → After pressed, leads to page 1.1.3.
- "Easter Eggs & Hidden References" → After pressed, leads to page 1.1.4.
- "Yearbook & Nostalgia Section" → After pressed, leads to page 1.1.5.

PAGE 1.2 - About Us (IKAF* Studio)

What users see:

- A scrollable and informational page, explaining the meaning behind the brand's logo, mission, objectives, values, and showcasing the brand's team.

Buttons:

- Viewing Arrows → Team Members' Section

PAGE 1.3 - Interactive Map

What users see:

- An interactive page that allows the viewers to press on each of IADE's building floors and see their architecture.

Buttons:

- Each Building's Floor → Specific floor plan.

Page 1.4: Feedback & Comments

What users see:

- An interactive section where people can react with emojis live.
- Other people's previous commentaries.
- A section where they are allowed to make their own commentaries.

Buttons:

- Emoji Button → When pressed, an emoji will appear in real time.
- Comment Section → Allows users to write and post their own commentaries.

PAGE 1.1.1 - Character Concept Art & Moodboards

What users see:

- Early sketches, before VS after, and short videos.

Buttons:

- Cards for each character.
- Swiping motion for each character's progress.

PAGE 1.1.2 - Environment Concept Art & Moodboards

What users see:

- Early sketches, before VS after, and short videos.

Buttons:

- Cards for each environment or object.
- Swiping motion for each environment and object's progresses.

PAGE 1.1.3 - Behind-the-Scenes

What users see:

- Making-of clips, voice overs and fun facts.

Buttons:

- Play / pause buttons for videos.
- Pop-ups for opening videos or photos, with a caption on it.

Page 1.1.4: Easter Eggs & Curiosities

What users see:

- Explained inside jokes and mini-games.

Buttons:

- No buttons are included for the explained inside jokes section.
- Interactive buttons for the mini-games.

Page 1.1.5: Yearbook & Nostalgia Section

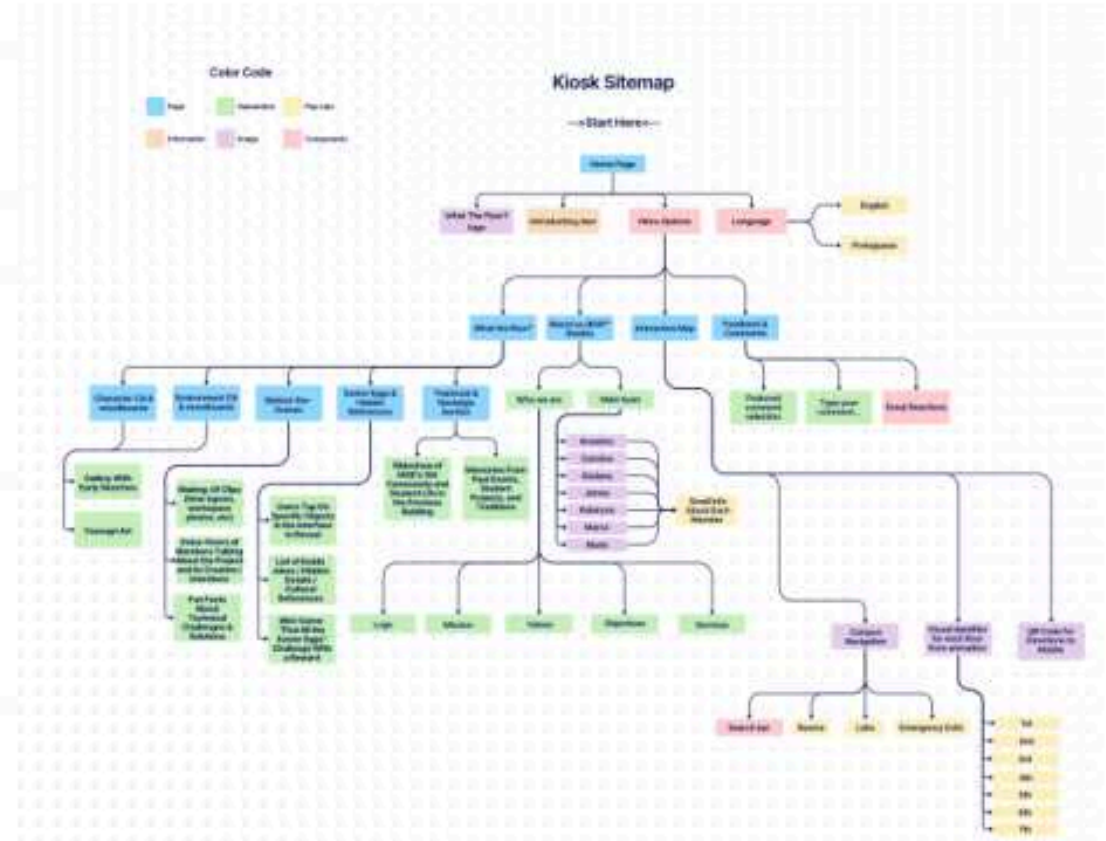

What users see:

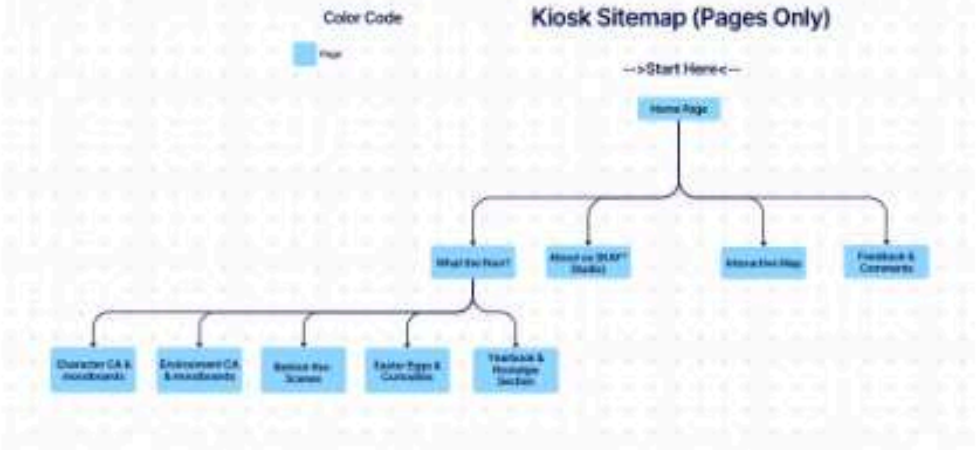

- IADE's old community and memories.

Buttons:

- Pop-ups for opening images, with expanding purposes only.

Sitemap

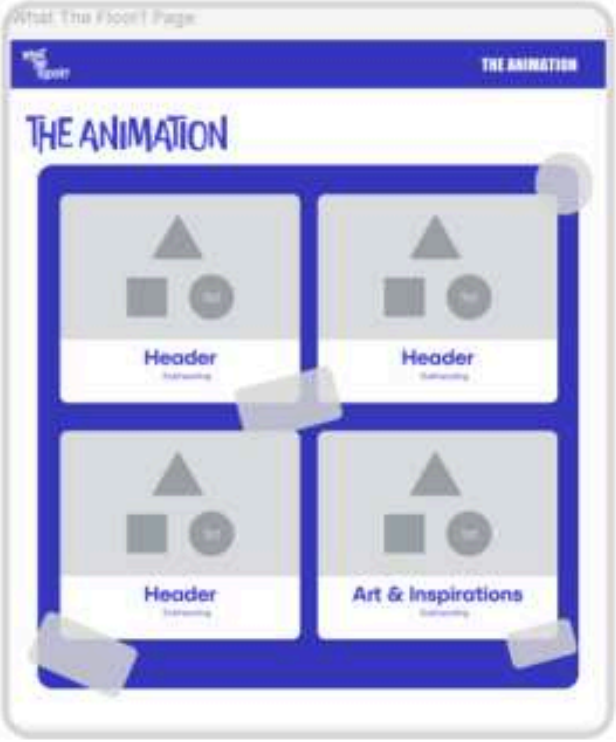

We've also developed the sitemap for the digital kiosk, carefully organizing the content into intuitive sections. Each department within the menu is assigned a specific color to enhance user experience and visual clarity. This color-coding is consistently applied across the interface — from the main navigation menu to individual buttons — helping users easily identify which section they are in and navigate through the kiosk more intuitively.
You can access both sitemaps on Canva with the following link:
https://www.canva.com/design/DAGjJx5WUuO/PUOOP0zwQ2_gD1tCFC5AKA/edit?utm_content=DAGjJx5WUuO&utm_campaign=designshare&utm_medium=link2&utm_source=sharebutton

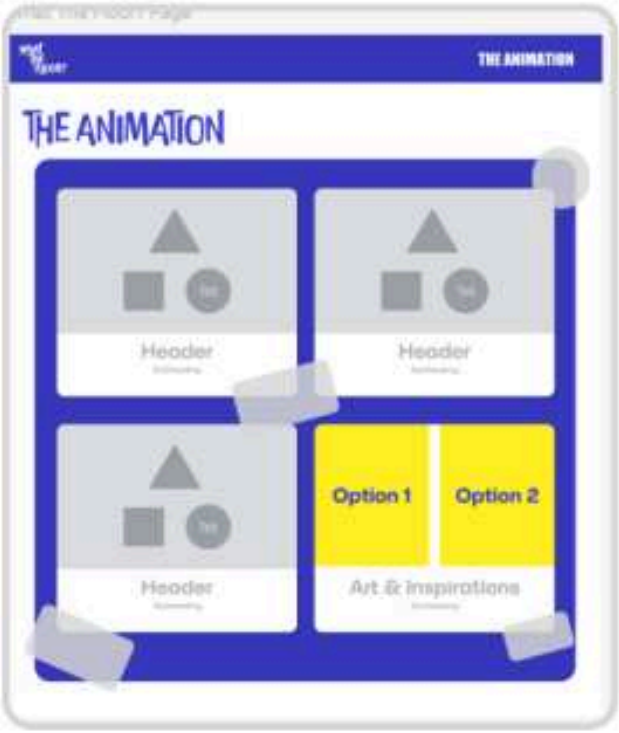

Patterns (Wireframes - LOW FIDELITY)

For the patterns section, we included a variety of low fidelity wireframes, with a few complementary pages that showcase feedback and microinteractions, including the pop-up dialogs, button hierarchy spread through the designs and navigation logic, since the buttons on the screens indicate the page to which they would lead to. The following images will illustrate the content present in the section, but accessing the Figma link, will guarantee complete access to the content.

7.8 Iterations & Testing

Navigation - Prototype Architecture

in this section, we included a variety of high-fidelity prototype wireframes, with all the pages and interactions we had planned to include as well as visual complements that reference our animation as a whole. The following images will illustrate the content present in the section, but accessing the Figma link, will guarantee complete access to the content.

Link (Prototype): https://www.figma.com/design/su6WeletRPG2pf3iTFYYdl/WTF-KIOSK-PROTOTYPE?node-id=79-844&t=f5sN7gg8ETlvSBcJ-1

Link (Design System): https://www.figma.com/design/ZCZFh1aqlagkNFzMb3I57f/WTF--DESIGN-SYSTEM?node-id=69-12670&t=U8viELfoDMDapyqP-1

We have created a main page with buttons that navigate users to various pages, each showcasing one of four themes (The animation, Interactive Map, IKAF* studio and Feedback).

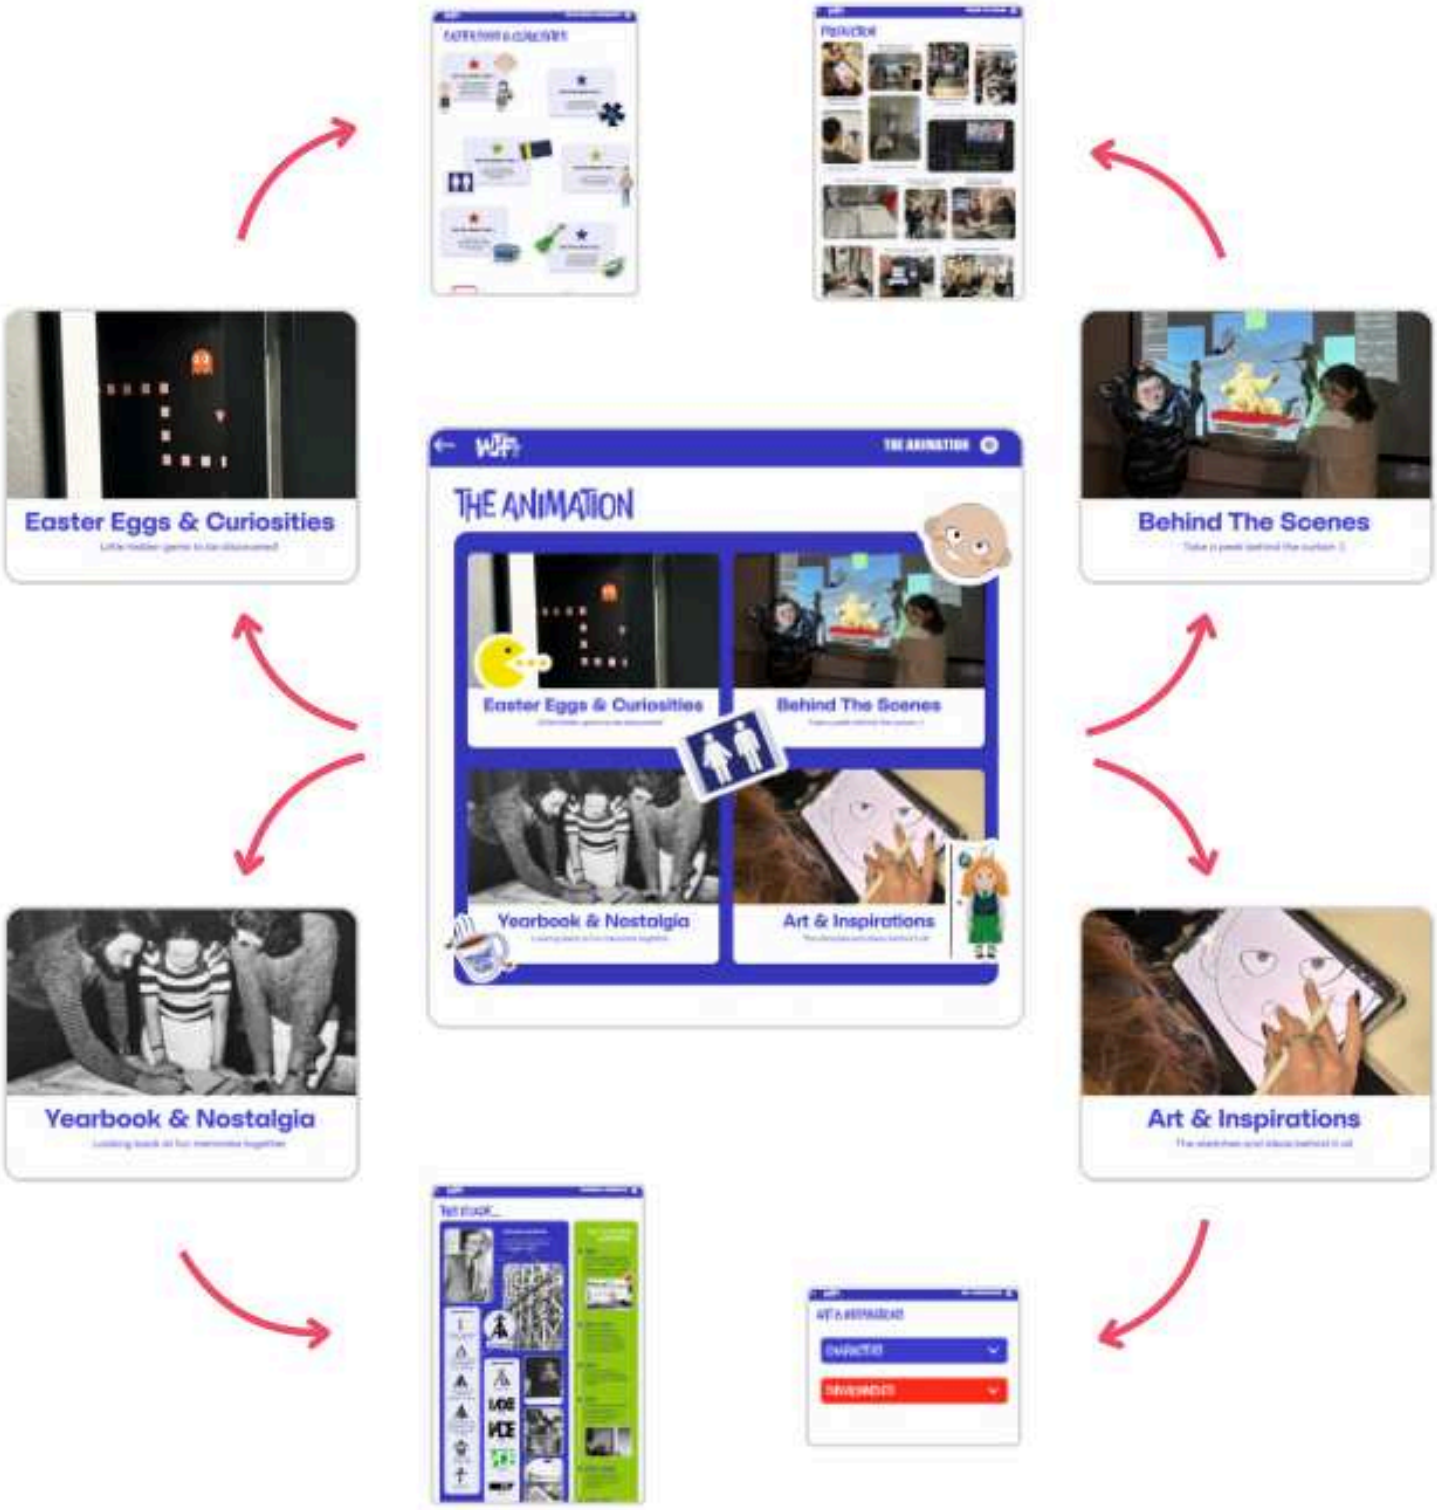

Page 1 - The Animation

The animation page also works as a submain one. Here is the same pattern with four different sections to choose (Easter Eggs & Curiosities, BTS, Yearbook & Nostalgia, Art & Inspirations).

Page 2 - About IKAF* Studio

On the "About IKAF* Studio" page, you can scroll down the page from top to bottom to read information about our Studio. At the end of the page you can find a menu where you can then click on each member to find out more information via a popup.

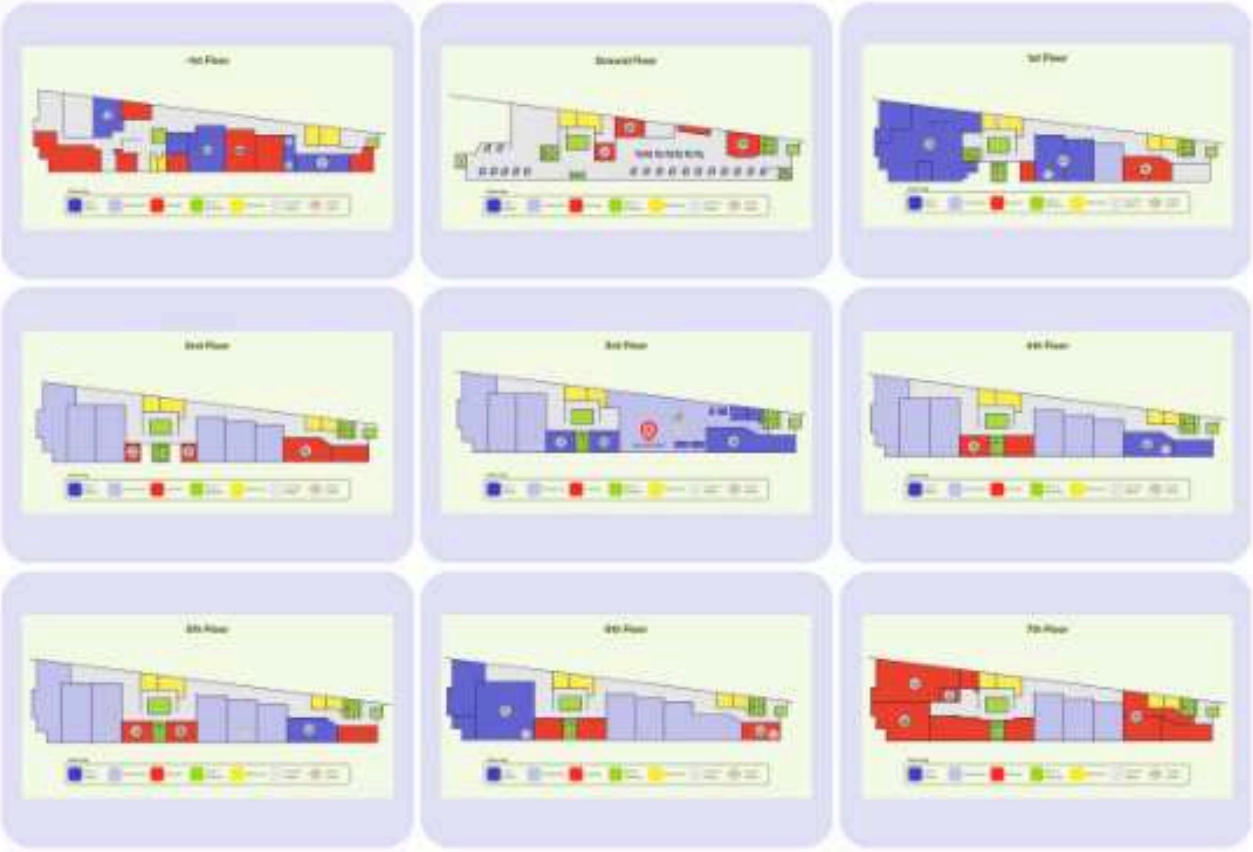

Page 3 - The Map

For the section of the interactive map, we decided to create visual representation fo building with all the floor, resembling the one from our animation. It was created to be an easy way to separate each of the maps in the visually simple way. The colors helps create these separation, but include the numbers on them to ensure complete understanding. The text on the side also supports the usability by helping guide on what they can do and see in this page. As users click on the floor they get to see each of the floors' 2D map with all important areas highlighted with icon tag (with tooltips), all color-coded and simple design to ensure very easy understanding. We made sure to include a "You are here" mark to further facilitate users localization throughout the building.

Page 4 – Feedback

For the feedback section, we decided to structure the digital kiosk in two sections: the first is about the emotions triggered by watching the video mapping show, where the user can select the emotion that most characterises them after having watched the animation. After this screen, the user can move on to the next phase, leaving a comment and reading the reviews of people who have done so previously. To access this second page, there is a button at the bottom right. It is possible to skip the review page by returning directly to the home page.

Heuristic Evaluation

Upon completing our high-fidelity prototype, we needed to understand the positive and possibly negative aspects of our interface. To do that, we conducted a heuristic evaluation to assess the usability and user experience of our "What The Floor?" digital kiosk prototype. The evaluation follows Jakob Nielsen's 10 usability heuristics, identifying strengths, potential usability issues, and areas for improvement. This ensures that our prototype provides an intuitive and accessible experience.

1. **Visibility of System Status**
   - Does every interface begin with a title/header that describes page contents?
   - Is selected icon / element highlighted from other icons / elements which are not selected in the application?
   - Is there visual feedback when objects are selected or moved?
   - Is the current status of an icon and element clearly indicated?
   - Is the user being informed of the system delay's (more than 400ms) via feedback?

Our kiosk clearly shows users where they are, like the selected floor highlighted in the map, with our navigation titles like "Home," "The Animation," "Map", and buttons provide a small but immediate feedback when it is pressed to help give a response of a functioning button. As for the feedback user get when interacting with our buttons, some more important or smaller buttons have a "while pressing" feedback that helps give a sense of security to the user that the button was or was not properly clicked, which the the best fitting interaction for a tablet interface. however, not every button has this response, so we could include in a few more. All functioning buttons in the prototype have responses and lead to somewhere and delay response for this type of interface we believe not be fully necessary.

2. Match Between System & Real World
   - Does the language used match the terminology expected by the IADE students?
   - Are icons and visuals intuitive and consistent with real-world concepts?
   - Are icons concrete and familiar?
   - Does the product use computer jargon and technical language?
   - Do menu choices fit logically into meaningful categories?
   - Does the product automatically enter dollar/rupee symbol for monetary values?
   - Does the product automatically enter commas in numeric values greater than 9999?

They language we used is mostly simple and straightfoward, with hints of playfulness and aligns with IADE students' and our animation's tone, for example we used "Let the others know what you think!" and "peek behind the curtain"). Also, our interactive map matches the real IADE building, everything labeled logically and created to be easy to use and understand, with recognizable icons, and even for those that may be more specific, they all have complementary captions as an interactive button to ensure full understanding.

Heuristic Evaluation

3. User Control & Freedom

- Can users easily return to the home screen or previous step if they navigate incorrectly?
- Incase of multiple menu levels, is there a way to go back to previous menus?
- Can users cancel out the actions that are in progress?
- Do prompts imply that the user is in control?
- Are users prompted to confirm actions that have drastic, destructive consequences?

Users can easily go "back" or select other sections on the header through the clear white arrow in the top-left corner. Logos are also commonly known to take users back to the interface's homepage, which happens in ours too, so they can go back to just the previous page or directly to the homepage. However, for long scroll pages, including a "back to top" button might be interesting. and faciliate usability.

4. Consistency & Standards

- Are the same buttons, icons, and menus used consistently throughout the kiosk experience?
- Are form fields case sensitive (when applicable)?
- Are all the icons labeled?
- Does the UI avoid heavy use of all uppercase letters on a screen?
- Have industry standards been followed consistently in all screens within the product?

Our visual and typographic language is consistent throughout the interface making the experience consistent and positively predictable. We also used elements from WTF's identity to keep everything in the show cohesive. In terms of common practices with UI design, we included labeled icon buttons, we used all uppercase in very specific places that won't disturb the usability. The comment section input area can feel less visually connected to rest of the system, which could be altered. In standardization of our interface, all pages follow mostly the same layout structures, with changes that support the content present in it, but we could make alterations in color choices and pairings to ensure that things are cohesive throughout.

5. Error Prevention

- Are interactive areas clearly distinguished to avoid accidental touches?
- Are the icons/actionable items intutive?
- Are the menu items non generic?
- Do icons have captions?
- Are all links recoganizable?

Content flow is linear and intuitive, with no buttons too close together, which minimizes chance of mistakes. The floor selection on the map might be the only closest one but its still has clear color distinction and very easy and intuitive options to go back. The only icon used without a caption is the gears, symbols, which is universally know for settings for the interface. Our main menu is the homepage has not very traditional options but the four available are relevant and easy to understand within the context of our videomapping show.

6. Recognition Rather Than Recall

- Are navigation options visible on each screen instead of requiring users to remember where they are or how they got there?
- Do similar items interact and behave in same way?
- Is size and color of components consistent?
- Does the layout follow user's mental model?
- Is all the information needed to complete an action available upfront?

For the maps, the navigation through the floor maps is always clear with the floor number clearly stated. In all screens, we also have clear headers, indicating the section users are in, but we dont have an area like a short menu for each page, given the size of the kiosk interface, the path to reach certain sections is fairly short not too overwhelming to remember.

7. Flexibility & Efficiency of Use

- Does the system provide shortcuts for efficiency?
- Are the shortcuts customizable?
- Does the system provide mutiple options/ways to complete an action?
- Does the system scale for new users as well as advanced users ?

Our interface is a simple experience first-time users and repeat visitors with clear names and descriptors for some sections. Given the simplistic approach taken to presenting information in our interface, there weren't any eminent needs for shortcuts. As for multiple options to get to complete specific tasks, again not many because everything is labeled and easy to access, with menu options clearly stated and back options, allowing for a lot of freedom to exploration the platform.

8. Aesthetic & Minimalist Design

- Is the visual design clean, uncluttered, and in harmony with the video mapping content?
- Is only (and all) information essential to decision making displayed on the screen?
- Does each icon stand out from its background?
- Are meaningful groups of items separated by white space?

The visual design has a playful collage direction that fully connects the kiosk to the videomapping show and narrative tone. Although there presence could be somewhat overwhelming, we were able to keep them in ways that wouldn't hinder and only contribute to the experience, like in the easter eggs scene, where the help illustrate the scenarios presented in each curiosity. There are no excessive information and everything is organized into sections or small blocks, which facilitates the balance between the simplicity and the fun-collage touch.

9. Help Users Recognize, Diagnose, and Recover from Errors

- Are prompts brief and unambiguous?
- Do error messages suggest the cause of the problem?
- If there is an input error, does the product highlight the error/formfield?
- Are prompts stated constructively, without overt or implied criticism of the user?

The nature of our interface being more informative and explorative for users, make it so that specific tasks within it, don't actually occur, for purposes of understanding its usability is being sure that users can interact and recognize all interactive elements with no to few issues. Also, including error messages could make the experience more cluterred for not being exisplicitly necessary and possibly only added if certain paths weren't met, but again, the free exploration makes it so that error messages aren't huge necessities in terms of usability. However, we do have error options for form elements, like in the comment section included into our design system, that can fulfill this role and potentially help users in case of any mistakes.

10. Help & Documentation

- Is help provided if a user interacts incorrectly (e.g., touches a non-functional area)?
- Is the help function clearly visible?
- Can users easily switch between help and their work?
- Can users resume work where they left off after accessing help?
- Is there context-sensitive help?

We have not include specific help buttons or instructions for the use of the interface, which we could add to specific areas that could make sense. Once again, given the nature of the kiosk and the simplicity with the content and design, a help button wouldn't be a valuable contribution. However, small indications like extra arrows or written instructions in italics, provide help to minor takss within pages that can contribute to the experience, so we could consider adding more of these to possibly complicated tasks and interactions, or improve the currently existent ones. We also included short instructions in potentiall more difficult to use sections, like the interactive map, which also has interactive tooltips on its icon tags, ensuring that the location is understood without being dependant exclusively on the icon.

1st Iteration - Improved Kiosk

After completing a heuristic evaluation of our kiosk prototype, we realized some areas that needed some minor improvements to ensure that our interface was easy to use, uncomplicated, clear and included all items that users might find necessary. The following images and supporting caption will highlight all the changes made post-evaluation.

Adjusting contrast of the buttons

Back to the top button

Functioning settings button for language options.

We altered the positioning and size of the arrow for clearer instructions.

Changed the size and placement of the popup buttons

We created a motion design to introduce the Digital kiosk. On the 'INTRO 1' screen there is the 'tap the screen to start', then, once the screen is tapped, Aster gets bigger and bigger, with a 'bounce' animation, until the entire screen goes completely white.
After this motion design, the first 'What the Floor' screen appears.

Usability Testing

Link to **Prototype**: https://www.figma.com/design/su6WeletRPG2pf3iTFYYdl/WTF-KIOSK-PROTOTYPE?node-id=79-844&t=f5sN7gg8ETlvSBcJ-1

Link to **Design System**: https://www.figma.com/design/ZCZFh1aqlagkNFzMb3I57f/WTF--DESIGN-SYSTEM?node-id=69-12670&t=U8viELfoDMDapyqP-1

1. Objectives and Methodology

Objective:

The main objective of this usability test was to validate the user experience of our digital kiosk prototype developed for our video mapping show, "What The Floor?". The kiosk includes various sections such as behind-the-scenes content, concept art, a map of the IADE Santos campus, Easter eggs, and interactive features like a comment section.

We aimed to assess:

- Ease of use
- Navigation clarity
- Engagement with content
- Interface usability and visual design

This was done to ensure the kiosk is ready for final use during the video mapping exhibition.

Methodology:

To evaluate the usability and overall user experience of our digital kiosk prototype, we conducted structured usability testing with four participants who represent our target audience.

Each participant was provided with a direct link to the Figma prototype. Before beginning the test, they were given a brief verbal introduction outlining:

- The purpose of the test (to evaluate ease of navigation, clarity of design, and engagement with content).
- That they would be asked to complete a series of realistic tasks simulating kiosk interactions.
- That no assistance would be provided during the task execution, to simulate a real user experience.
- That we encouraged them to think aloud while interacting with the prototype to capture their thoughts and reactions in real time.

Participants were asked to record their screen as they completed the tasks.

In most cases, we were present remotely during the session to observe silently and only interacted before and after the testing to provide context and gather reflections. This ensured unbiased user behavior, while still capturing important qualitative data.

After completing the tasks, each participant filled out a Google Form questionnaire.

By combining task-based analysis with self-reported user feedback, we gained both objective and subjective insights into the strengths and areas for improvement of our kiosk experience.

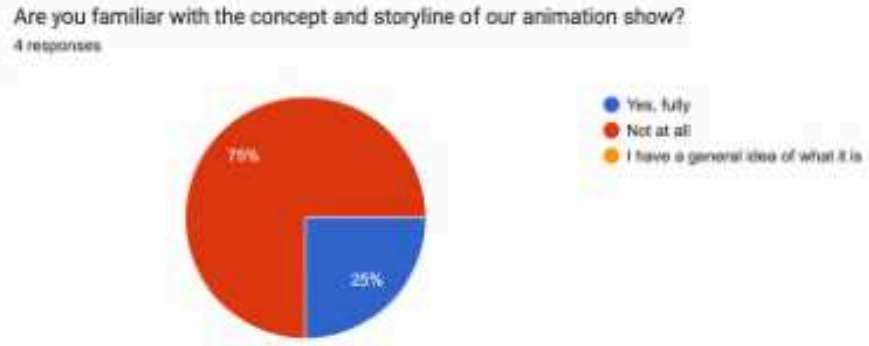

2. Tasks and Participants

Tasks:

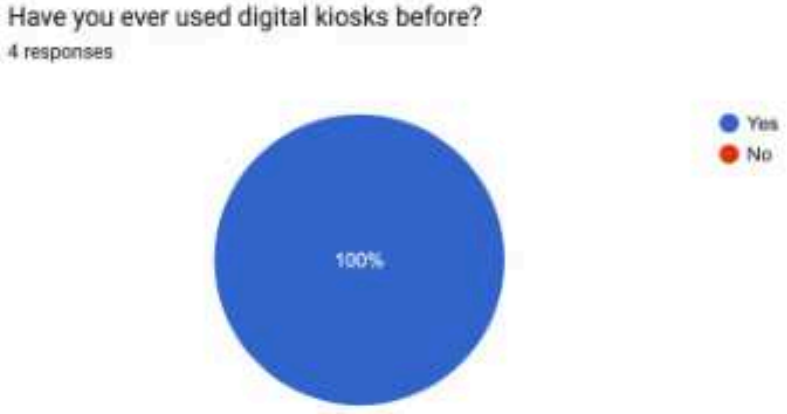

- Task 1: Find out the curiosity about Aster.
- Task 2: Locate information about our main character Twister's concept art.
- Task 3: Check out our yearbook nostalgia page to see photos about student life.
- Task 4: Read about ikaf studio's values.
- Task 5: Find information about any member of ikaf studio.
- Task 6: Find out where the 3D lab is in the 1st floor of our building.
- Task 7: Give feedback on our animation via the kiosk.

Participants:

- Number of users: 4
- Profile: University students aged 18–23 / Adults aged 50–51

The biggest percentage of participaants did not know the concept and were shadowing the tasks. This could influence part of the results, given that the kiosk is complementary to the animation, so certain details that connect to the animation might not make sense immediately to these participants.

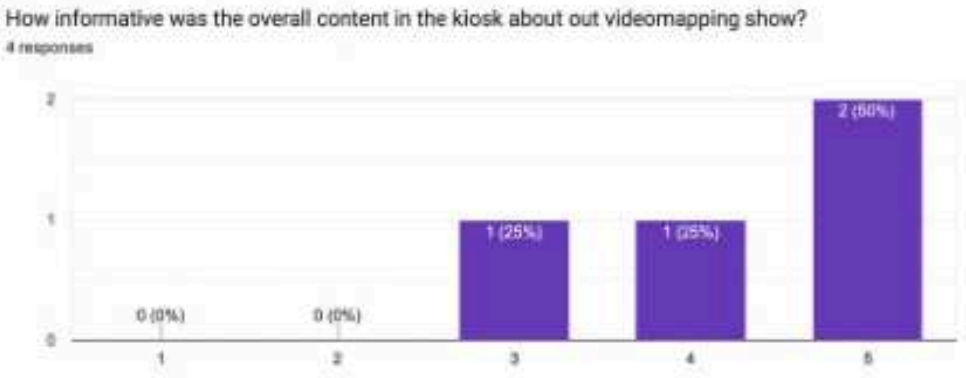

All of the pasrticipats are acknowleged with digital kiosks and have used some. This allows us to presume that certain most common actions within digital kiosks will not be complicated, or if problem arise that they are probably not related to difficulties with using the kiosk as an interface choice.

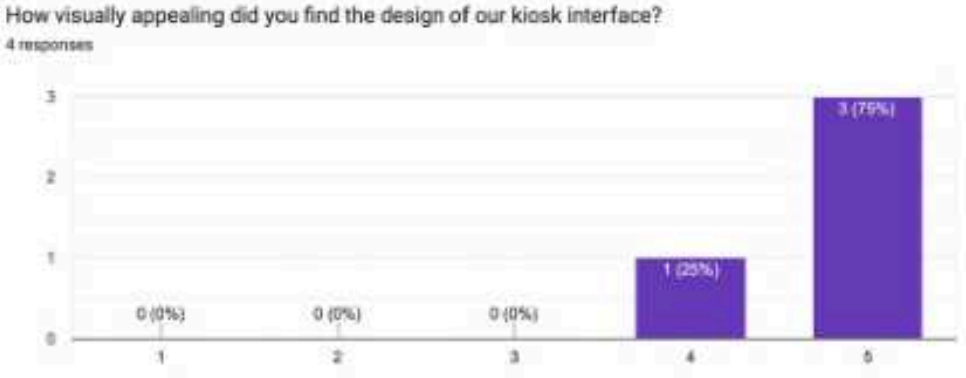

3. Observations and Findings

Link to the video of the Digital Kiosk Testing with comments: Link to questionnaire results: https://drive.google.com/drive/folders/1IXVaig2l61gSc4uJkZjFVEmCB3tFKsWG?usp=sharing

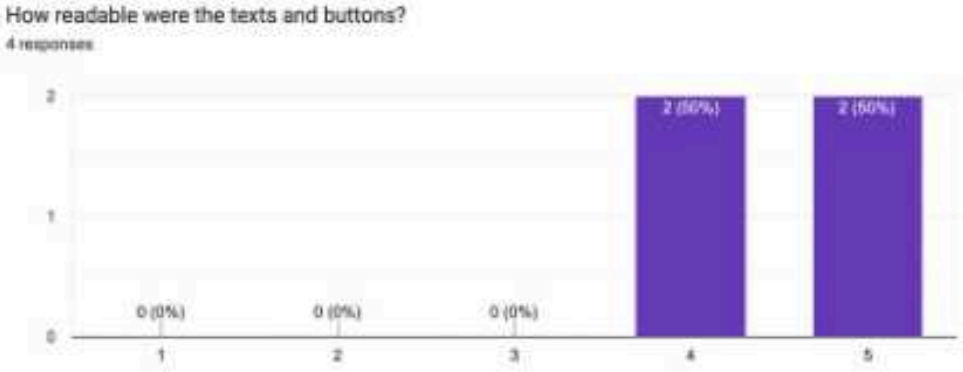

Link to questionnaire results: https://docs.google.com/forms/d/e/1FAIpQLSeLCBwyJccVWeAf2f9yJjy9_E4z0gog7ZcglAgsUkCy-bxeMw/viewform?usp=sharing&ouid=100397090180487702376

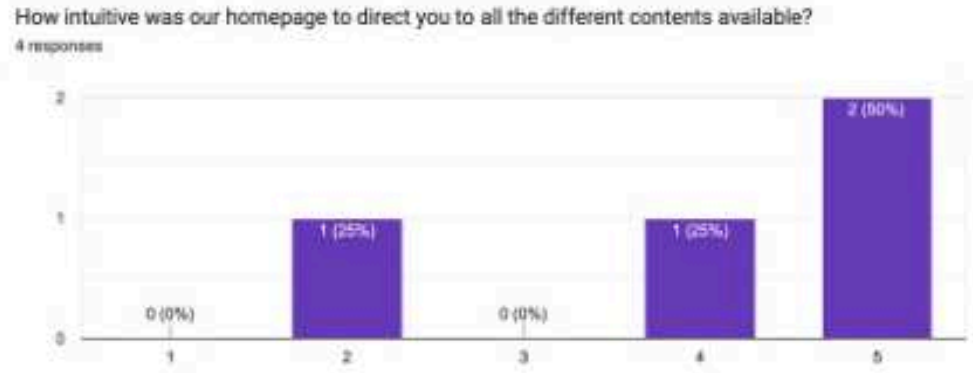

Most participants found the content informative, with two giving the highest rating. One participant rated it lower, which might be related to a lack of prior familiarity with the show's concept or structure. The test indicated that users familiar with the animation understood the context and information more easily. Future audiences who don't know the show might benefit from more introductory context earlier in the kiosk flow.

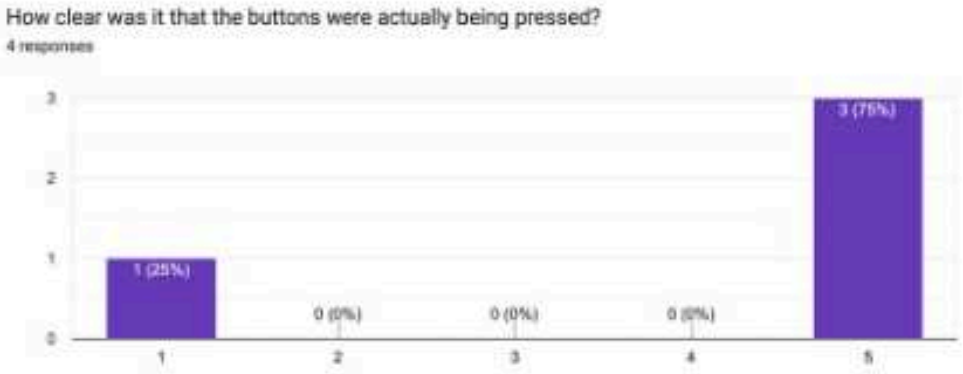

Participants responded very positively to the overall look and feel. Comments during testing included appreciation for the colors and interface style. No visual clutter or immediate layout issues were observed, and all users engaged with the design in a focused and interested manner.

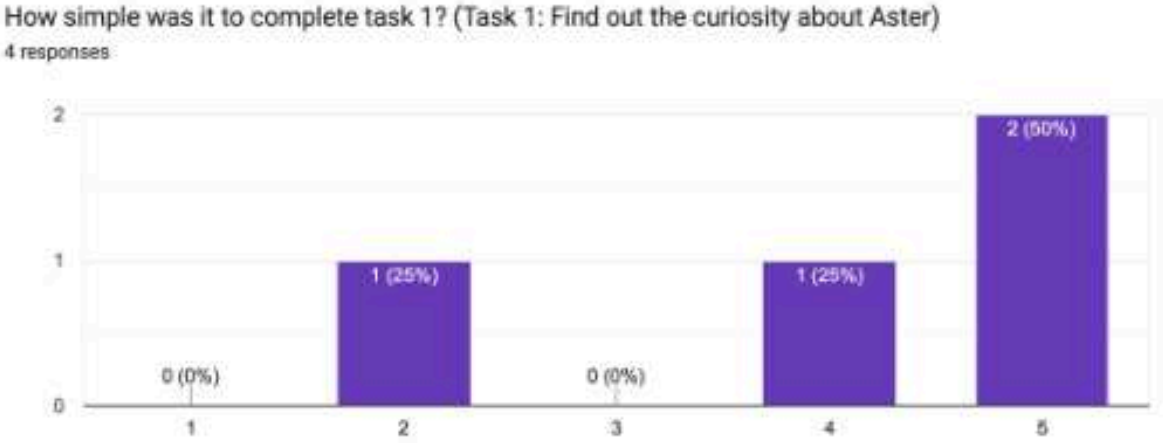

All users were able to read and navigate the interface without major issues. Only one participant mentioned more difficulty seeing the icons in the map, but nothing impossible since the color key helped identify what was necessary. However, a slight increase in contrast might beneficial for little situations like this.

Most participants navigated the homepage confidently, but one struggled to understand where to begin. This hesitation was reflected in the task recordings, where there was some delay before distinguishing between main sections in order to complete the task. Hence, the struggle was more in knowing what to expect from each category to complete the task than the interface or its buttons. All users were able to read and navigate the interface without major issues.

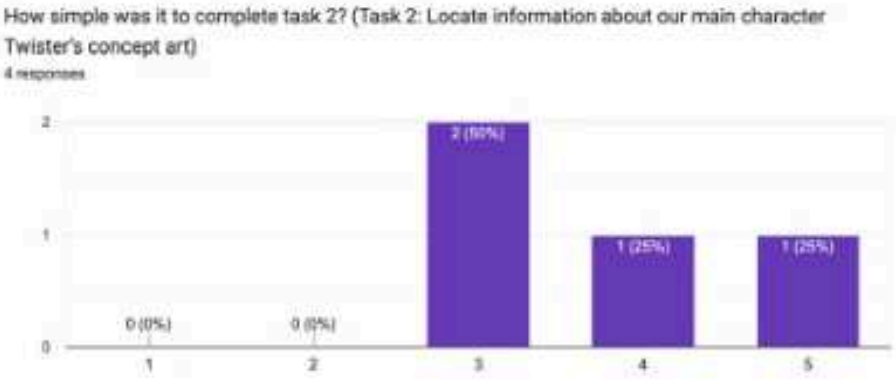

The majority of participants understood button feedback and navigation transitions, particularly after initial interactions. However, one participant felt unsure whether buttons were being activated. Partially related to the back buttons, with some errors of proper connection between pages, but also in areas with sliding cards or icons in the map, that might have been small and weren't being clicked exactly where it was necessary. Making them slightly bigger might be beneficial.

Task 1: Find out the curiosity about Aster.
Observations:

- All participants completed this task successfully.
- One participant showed minor hesitation understanding the phrasing of the task rather than the interaction itself.
- The section was generally well-located and visually appealing.

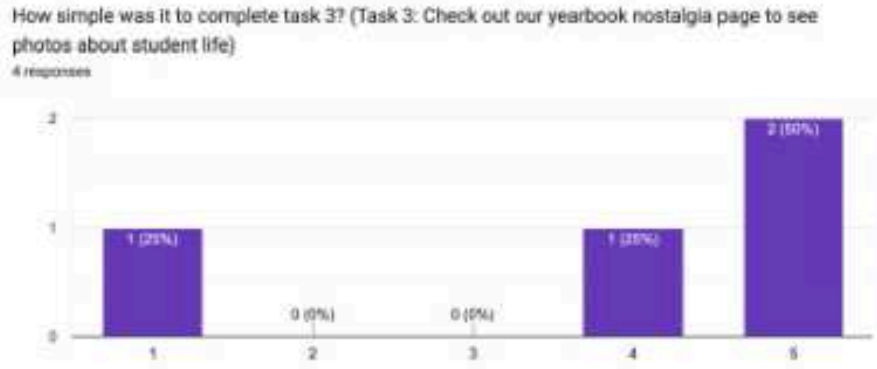

Interpretation: While most found the task relatively simple, one participant rated it as more difficult, which may be due to unclear phrasing of the task objective ("curiosity about Aster") rather than the interface itself, because they might not have understood the connection between Aster to "The Animation" section.

Task 2: Locate information about our main character Twister's concept art.
Observations:

- Slight confusion observed around using the arrow navigation on the right side of the screen. Users attempted to press other parts of the card or section.
- One participant attempted to click on non-clickable elements, expecting them to be interactive.

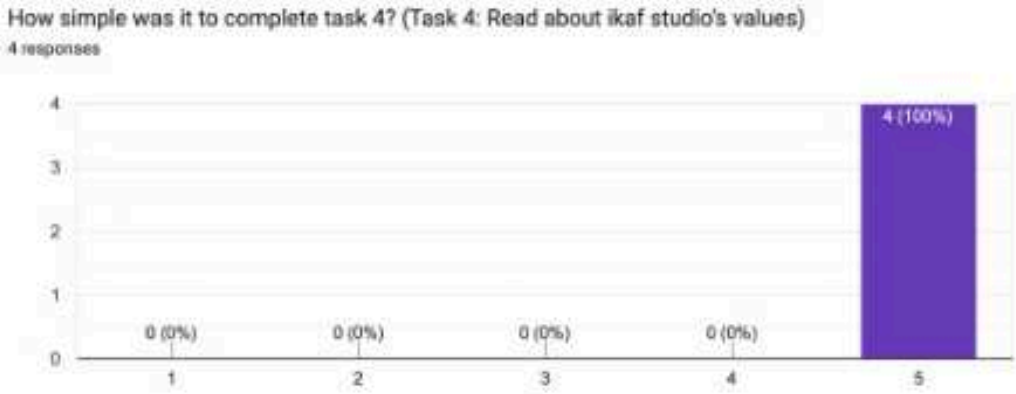

Interpretation: The average score suggests room for improvement in navigational clarity. This feedback supports a need to make entire card areas clickable, not just the arrow. One participant felt unsure whether buttons were being activated, likely due to a lack of immediate or animated feedback on click. The majority, however, understood button feedback and navigation transitions, particularly after initial interactions.

Task 3: Check out our yearbook nostalgia page to see photos about student life.
Observations:

- One user struggled to locate the page due to lack of knowledge about the animation structure, they didn't expect nostalgic photos to be inside the "Animation" section.
- This affected flow and confidence during the task.

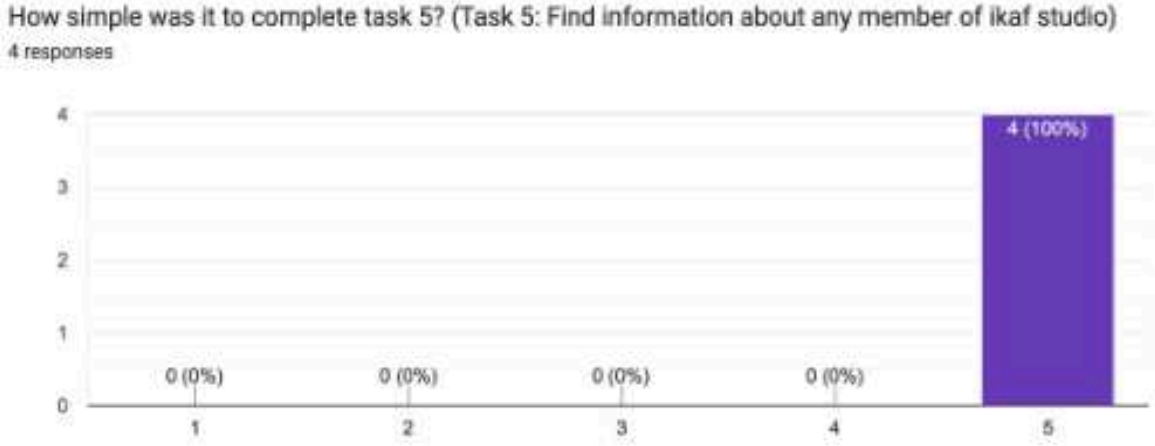

Interpretation: Feedback suggests that while most users found the task manageable, placement of the yearbook may be contextually confusing for new users, or those unfamiliar with the somewhat nostalgic vein conveyed in our animation that would connect or, therefore, justify the presence of the yearbook page.

Task 4: Read about IKAF Studio's values*.
Observations:

- All participants completed this task smoothly with no signs of hesitation.
- Navigation was straightforward and intuitive.

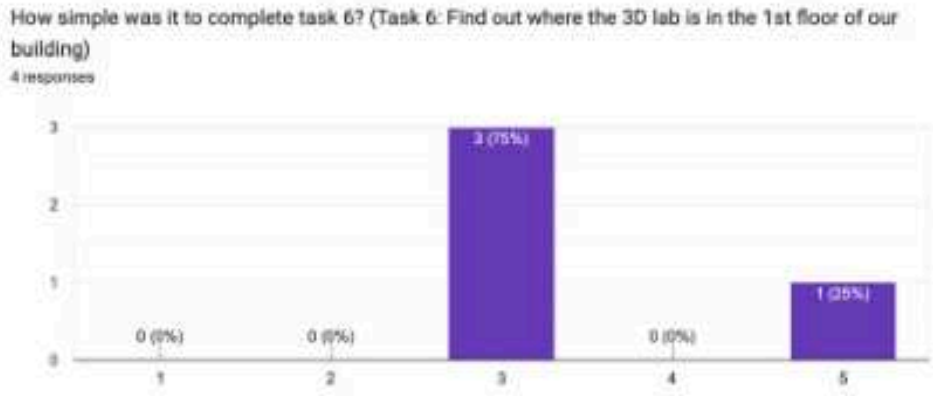

Interpretation: This task was consistently successful and shows that clear labeling in homepage was sufficient for users understanding and that our content structure strongly supports usability.

Task 5: Find information about any member of IKAF Studio*.
Observations:

- Slight hesitation was noted due to the sliding window structure. Some users didn't realize more profiles were available unless they scrolled.
- No major issues, participants eventually found what they needed.

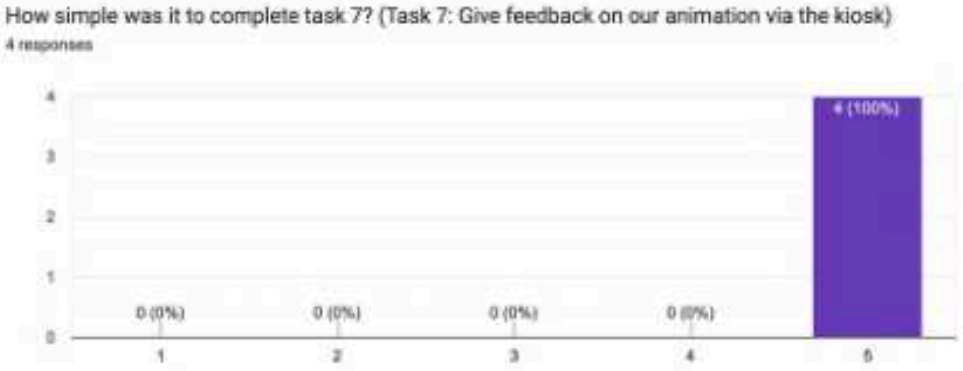

Interpretation: Overall ease of completion, but small UI affordance improvements (like a thicker swipe indicator or scroll arrow) could help first-time users discover hidden content more quickly.

Task 6: Find out where the 3D lab is in the 1st floor of our building.
Observations:

- The map interaction was the most challenging task.
- Most users had some sort of struggle to understand that grey icons were clickable and did not initially recognize them as interactive.
- One participant mentioned it outright in the questionnaire.

Interpretation: This task had the lowest clarity. The lack of contrast in map icons and absence of visual cues (like hover states) made it harder to complete. These kind of button on a computer with a hover might have been much clearer, but for a Ipad, the affordance of it being interactive wasn't clear enough. Adjusting the color contrast, adding a shadow effect and/or a simple instruction text like "Click icons on the map to explore") could resolve this.

Task 7: Give feedback on our animation via the kiosk.
Observations:

- All users completed this task easily.
- The comment interface was intuitive and enjoyable to interact with.

Interpretation: High usability, no friction, and aligns with the feedback in the recordings. No issues identified finding the feedback page, especially after many tasks, and encountering the button visually through other tasks. Progressing through it was easy too, with no notified issues with readability or progression, even without the possibility of actually writing a comment.

Did you find any parts of the tasks particularly confusing or difficult?

4 responses

I struggled with where to press in the interactive map and the grey buttons icons were not very intuitive to me

It was a little difficult to understand that the grey button in the map was clickable.

not exactly intuitive for the yearbook part to be on the "animation" part

"The animation" button doesn't make it obvious for me to find the content it has inside, but it probably has to do with how the tasks were phrased, because i think if i was just browsing i would have entered it first intuitively.

The map task (Task 6) was clearly the most confusing aspect of the test. Participants consistently mentioned the grey icons lacked clarity as interactive elements. This is reflected in both survey feedback and observed testing behavior. Additionally, some confusion came from content grouping, specifically, that nostalgic or yearbook content being located under the "Animation" section wasn't intuitive for users unfamiliar with the animation's context, which could be very much connected with the unfamiliarity with the animation's content or storyline, asked in the beginning of the questionnaire. Additionally, the manner in which we phrased each task might have also added to this issue, as participants later acknowledged they could have understood what needed to be done if the tasks were phrased differently or focused on a different part of the content, avoiding unnecessary confusions.

If you could improve one thing about the kiosk design, what would it be?

4 responses

I liked the overall experience

Nothing really, maybe the color of the buttons in the map.

better button readability

No it seems good.

Most users were satisfied with the overall design, without many improvement proposals. The only recurring suggestion was again related to the map buttons, either in terms of visibility or clarity. One participant mentioned improving button readability in general, even though it wasn't fully reflected in the readability question previously.

4. Conclusions and Reflections

The usability testing helped us better understand how real users interact with our kiosk and how intuitive the experience is across different tasks. While overall feedback was very positive, highlighting the design, content clarity, and user engagement, some areas of improvement became clear through observation and participant comments.

The test confirmed that most users could navigate the interface successfully and felt the experience was informative and enjoyable. However, we also saw some recurring confusion:

- The interactive map grey icon buttons were too visually subtle, and not fully recognizable as functioning buttons.
- Some users had trouble understanding that content like the yearbook photos was placed under the animation section, although that is implied within the animation's nostalgia feeling.
- A few struggled to recognize that buttons or sliders were clickable or expandable, especially when the click area was a little too small.

These insights are valuable and help us refine our prototype. Based on this feedback, we're considering the following adjustments:

- Improve visual contrast and affordance of clickable icons, especially in the map section.
- Make the entire button or card area clickable, not just the arrow or icon, for the "Art & Inspirations" section.
- Add brief context to sections like "Animation" to clarify what's inside.

This process was essential in validating what worked well and what could be more intuitive, helping us move closer to a fully deployable version of the kiosk.

The usability testing revealed that the kiosk offers a visually appealing, engaging, and generally intuitive experience for users. Participants appreciated the clarity of the content, the design aesthetics, and the ease of access to information about the video mapping show, IKAF* studio, and the IADE campus. All users were able to complete their tasks successfully, with only minor moments of hesitation in specific interactions such as navigation arrows or scrolling behavior.

Importantly, all participants rated the content engagement and readability very highly, and there was a consistent sense of enjoyment while exploring the prototype.

4.1. Reflections on User Feedback

Although the overall feedback was overwhelmingly positive, the testing process highlighted a few small opportunities to refine the experience:

- A couple of users showed brief confusion when interacting with the map icons or navigating via sliding windows.
- In some cases, visual cues (such as arrows or scroll indicators) could be slightly more intuitive.

These insights do not point to major usability issues, but rather small refinements that could make the experience even smoother for first-time users. As designers, we recognize the value of these observations and view them as fine-tuning opportunities rather than core design flaws.

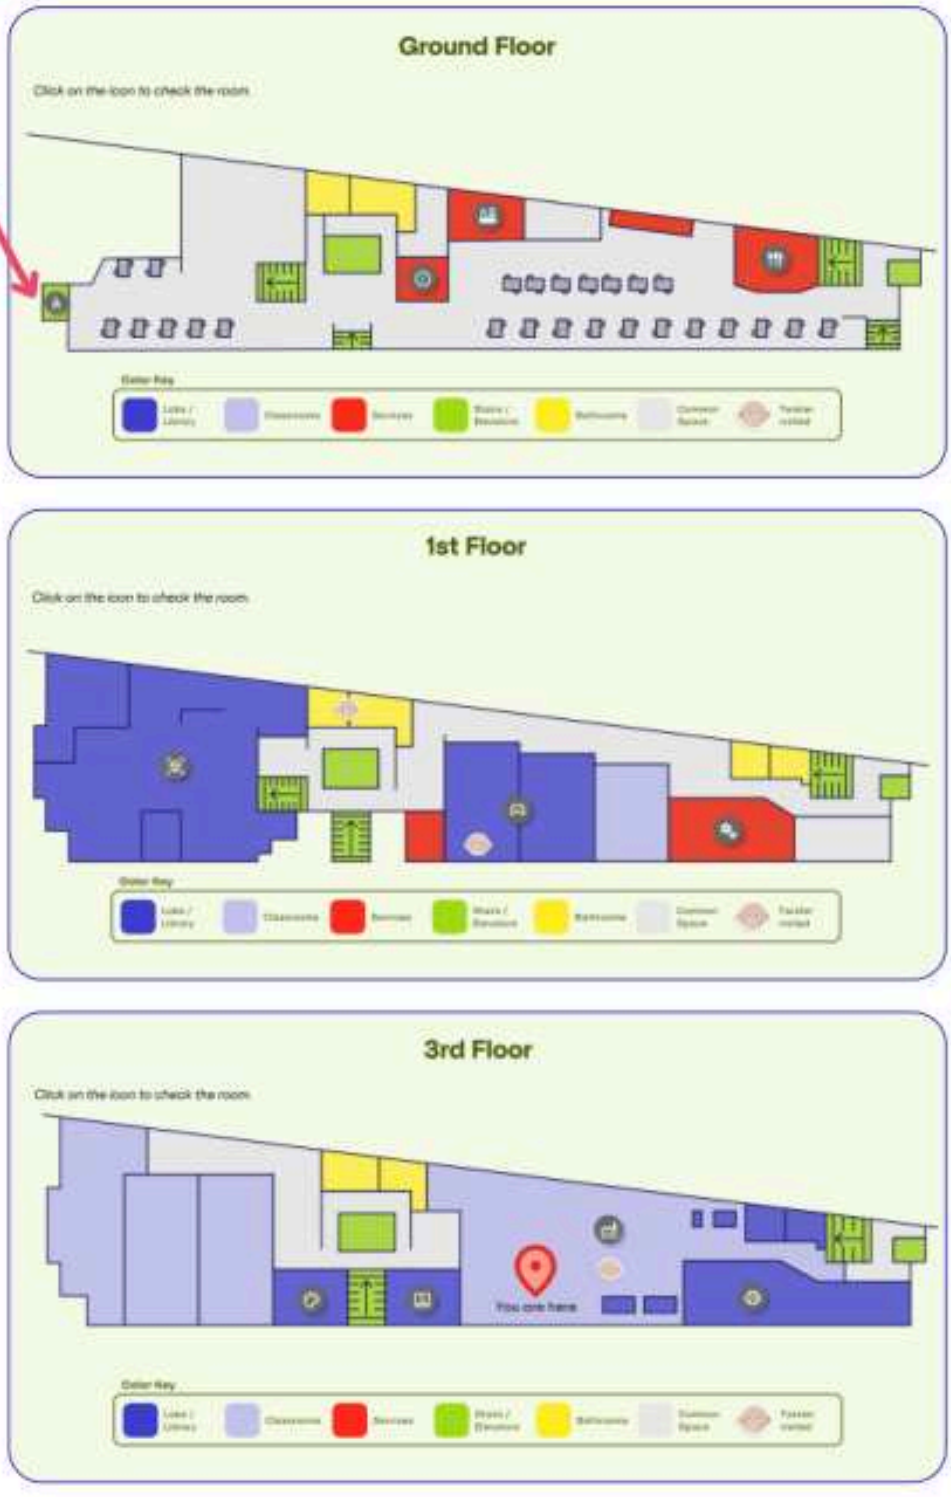

Final Thoughts

We are proud that the prototype successfully communicates the spirit of our video mapping show and encourages interaction. The feedback confirmed that the kiosk is not only functional, but also welcoming and enjoyable for its audience.

2nd Iteration - Improved Affordances

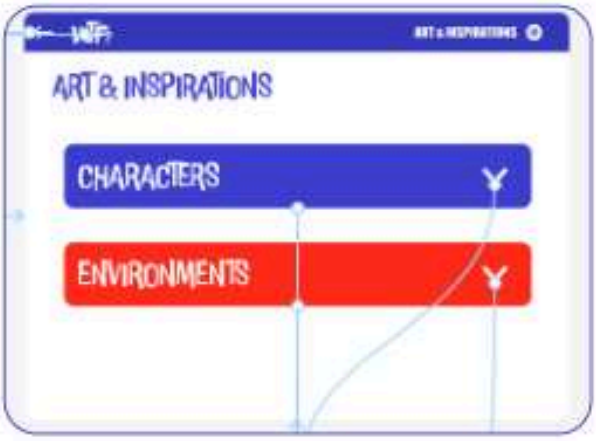

Upon analyzing the usability testing for our kiosk prototype, we realized some areas that needed some minor improvements to ensure that our interface was easy to use, uncomplicated, clear and included some things pointed out by users and others that we noticed during their usage. The following images and supporting captions illustrate all the changes made post-testing.

Adjusted contrast of the button, slightly enlarged them and added a drop shadow

Slightly increased font size of homepage buttons for better visibility

Added the entire rectangle as a functioning button to open the dropdown, not only the arrow.

Thickned arrow stroke for more visibility, making it easier to understand the swipe motion.

All theses changes allowed us to improve our kiosk's usability, ensuring that all participants can have a good experience and use it with no problems or difficulties.

08 behind the scenes

Behind the Scenes

08

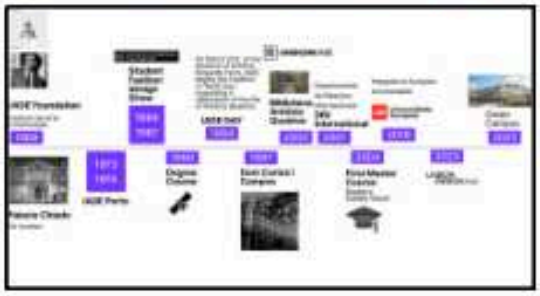

8.1 Milestone 1

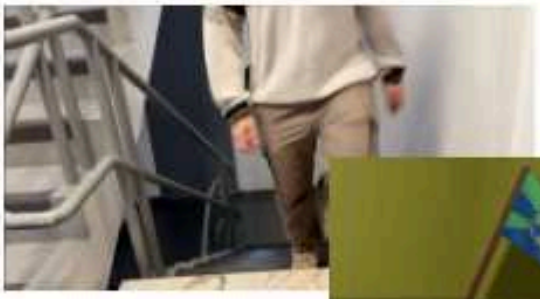

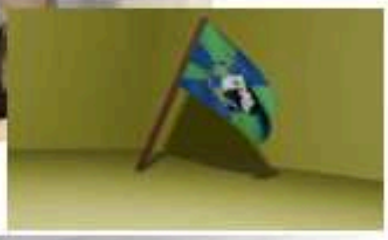

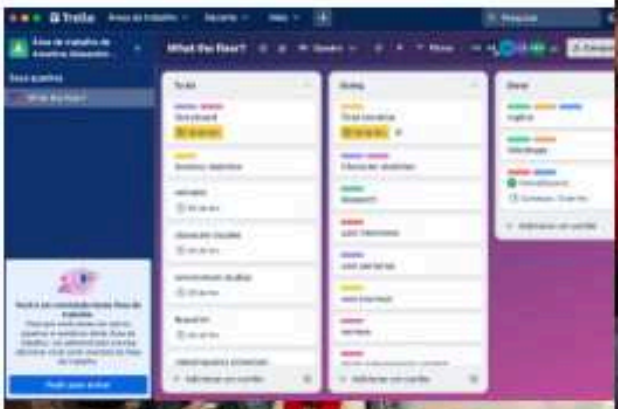

Defining our values
Open-mindedness: willingness to consider new ideas and approaches without judgement
Flexibility: the adaptive capacity of a system to accommodate various changes or modifications, ensuring it meets diverse requirements or user preferences
Fun: capacity adding some color and brightness to what we need to work on, yet maintaining a serious business
Quality: focusing on the good quality of our work and making it an evident thing for whoever sees it from outside
Reliability: ability of catching our clients' by allowing them to trust our work
Collaboration: being able to cooperate with various types of artists and creating a vast team
Respect
Community
Teamwork
Creativity
Transparency
Dedication
Efficiency
User-focused
Ambition
"Time is Money"
Approachability
Proactiveness

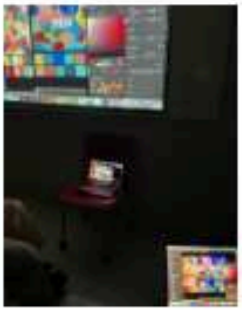

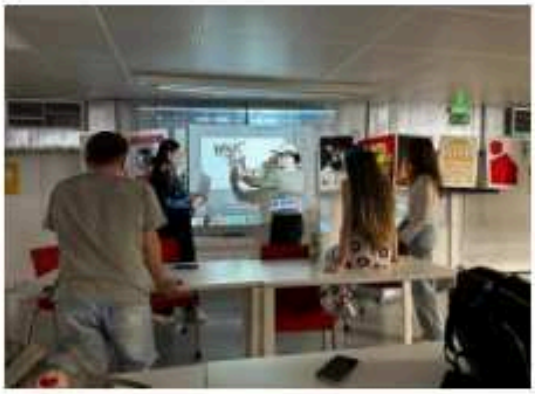

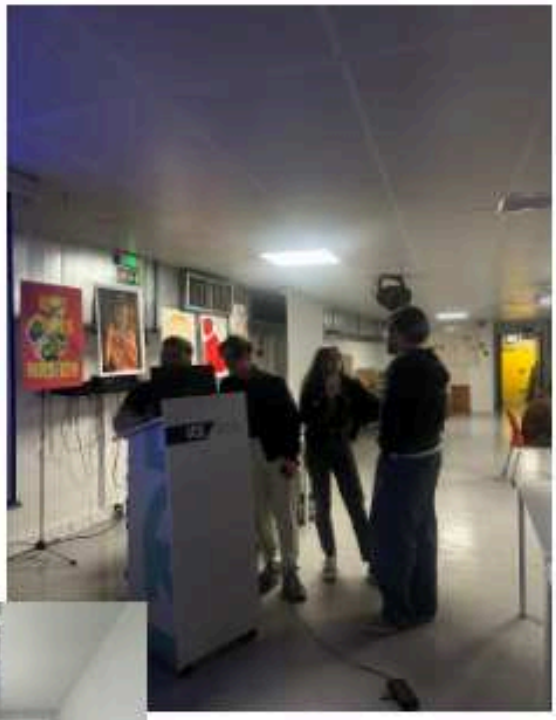

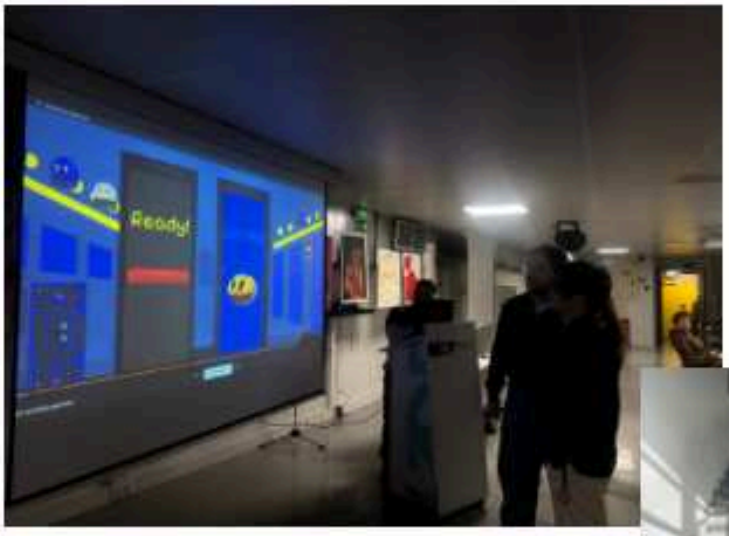

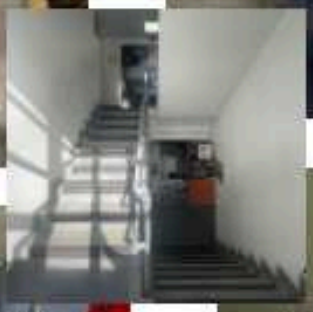

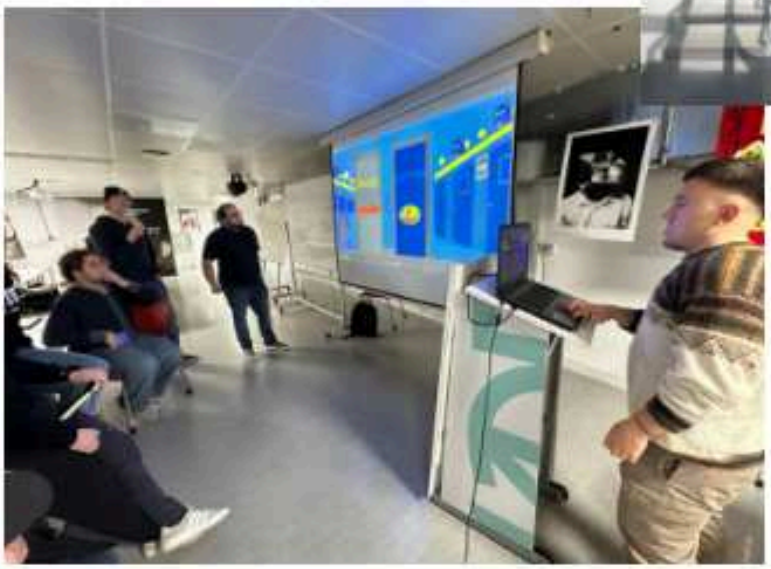

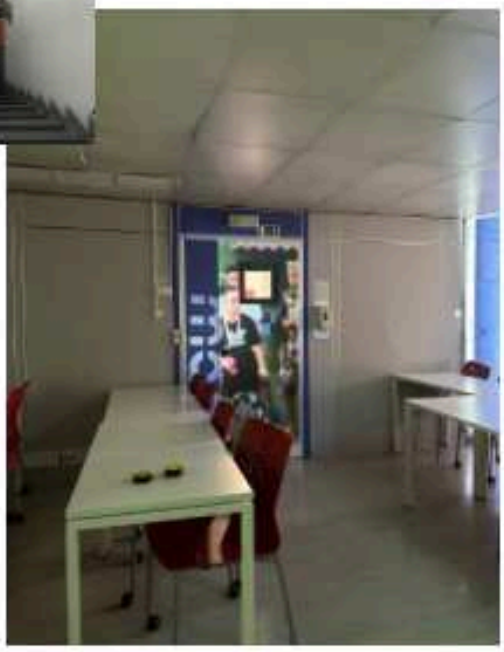

8.2 Milestone 2

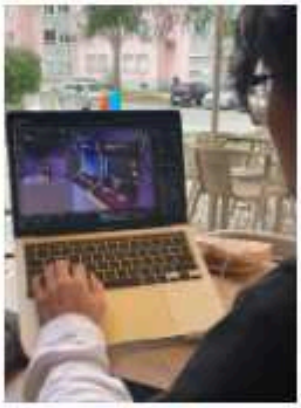

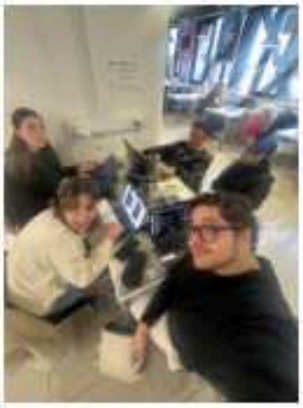

in pizza we trust

GENESIS
¡ADE!

8.3 Milestone 3

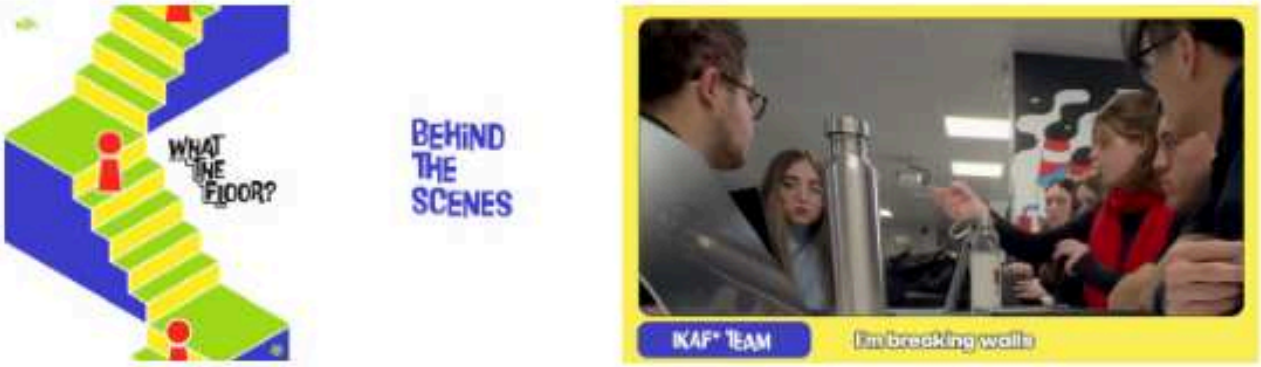

To showcase our hardwork and spirit throughout this project, we developed a short video including some highlights of our development and results with this project.
